## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

9 In an effort to make this document easy to use and understand, the requirements  
10 for the FTTS have been organized into levels. The capability requirements  
11 common to the FTTS platforms are listed in the base document. Annexes have  
12 been attached to the base document to provide organization to the detailed  
13 requirements. At each successive level, the requirements become more focused  
14 to individual system-unique requirements. Annex structure is shown at table \_\_\_\_.

15  
16  
17

18 FTTS blocking strategy is still in development/refinement. For the purposes of  
19 preparation for Milestone B decision, the FTTS requirements will be displayed  
20 with the threshold as the minimum acceptable operational value below which the  
21 utility of a system becomes questionable and the objective being the full objective  
22 capability.

23 **Definitions.** The following definitions apply unless otherwise stated:

24 **Curb Weight (CW)** = Empty vehicle, full fuel, lubricants, coolant, and BII.

25 **Gross Vehicle Weight (GVW)** = CW plus the weight of 2 soldiers (4 soldiers  
26 desired) and their individual equipment and weapons, trailer tongue weight (10  
27 percent of the towed load GVW), crew compartment protection kit, and payload  
28 (payload includes mission essential support equipment, unique digital appliqué,  
29 and non-mission essential kits, such as cargo compartment heater kit and cargo  
30 compartment protection kit). The planning factor per soldier with individual  
31 equipment is 343 pounds (weight estimates per Brigade Combat Team  
32 developmental weights).

33 **Gross Combined Weight (GCW)** = GVW plus weight of the towed load. All  
34 characteristics requiring evaluation at GCW shall be performed using the FTTS-  
35 MSV companion trailer at its maximum payload as well as towed loads required  
36 for specific mission applications.

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

37 **System Performance.** Unless otherwise specified, the following characteristics  
38 apply to all FTTS-MSV versions at GCW towing a representative trailer weighing  
39 (TBD) pounds having a tongue weight of (TBD) pounds over the Operational  
40 Mode Summary/ Mission Profile (OMS/MP) speed and terrain profiles. Following  
41 are the system operational performance parameters (capabilities and  
42 characteristics):

43

#### 44 **Design Characteristics:**

##### 45 **Responsiveness.**

46 **FCS information and sustainment systems** (FTTS-MSV) must support the  
47 simultaneous, multi-modal insertion of UA forces into multiple austere points of  
48 entry without reliance on fixed ports and staging bases.

49 **Rationale:** The Combatant Commander must have the ability to employ the  
50 UA using multiple points of entry with its organic command and control and  
51 sustainment systems that will allow unity of command and effort while dispersed.  
52 This requires the introduction of the UA at multiple points of entry that are  
53 unpredictable to overcome enemy access denial, to be able to leverage austere  
54 points of entry to increased force flow, to increase transport options available to  
55 the combatant commander. Analysis shows that the enemy, using asymmetric  
56 means, can inflict heavy damages before we are ready to fight, during  
57 conventional Reception, Staging, and Onward movement and Integration  
58 (RSO&I). We need the capability to operate without the requirement for  
59 elaborate APODs and SPODs, as well as the ability to project forces ready to  
60 fight. Entry into an austere theater, through multiple unimproved points without  
61 relying on fixed ports and staging bases, mitigates problems of enemy access  
62 denial strategies.

63 **Mission Profile.** FTTS MSV must be capable of employing over ranges of 600  
64 miles (Threshold) and 900 miles (Objective). Upon arrival, the FTTS must  
65 support the UA capability to conduct distributed and continuous 24-hour  
66 operations, self-sustained, for a minimum of three days without requiring  
67 reception and staging.

68 **Rationale:** Upon arrival, UA combat units immediately employ over  
69 operational distances (up to 400 km) to designated area(s) of operations a  
70 coherent, integrated combined arms team with the ability to conduct their core  
71 mission tasks with an area of influence of 75 km. FSB units must provide  
72 continuous support over distances of 60 km one way to combat units. FSB units  
73 must be able to march this distance several times within 3 days without external  
74 refuel.

75 **Operational Range (Key Performance Parameter (KPP)).** As a measure of fuel  
76 efficiency, fuel consumption and storage shall not be greater than current

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

77 predecessor systems over the mission profile representative terrain while  
78 maintaining an effective operational range of 600 miles (Threshold) 900 miles  
79 (Objective) before refueling.

80 **Rationale:** To achieve reduction in logistics footprint, sustainment forces  
81 must reduce fuel consumption and support forces over extended distances  
82 without pause. The threshold is representative of the doctrinal distances that the  
83 UA will deploy and the FSB must retain the capability to return to a sustainment  
84 site to resupply/pick up more supplies.

#### 85 **Payload.**

86 **Cargo module** (Annex A) and its **companion trailer** (LHS version) (Annex D)  
87 shall each carry 13 Short Tons (ST) total payload consisting of cargo laden  
88 flatracks / CROPS / modules / shelters / modular/configured loads and/or other  
89 containers / tank racks / quadcons / tricons or LHS compatible devices (i.e. with  
90 integrated bail bar or other LHS compatible lift point) (herein referred to as LHS  
91 payloads).

92 **Crew Cab.** The FTTS MSV shall provide capability for a crew of up to 4  
93 personnel (2 crews) to conduct 24 hour operations. Crew is defined by all prime  
94 mover and/or other systems' operators supported by the prime mover.

95 **Rationale:** The FTTS will be used to transport systems which typically  
96 have a crew of 3-4 operators. Having a cab capable of carrying up to 4  
97 personnel will allow 24 hour operations while reducing vehicle requirements for  
98 transporting equipment operators.

99 **Seating.** All seating shall be designed to safely accommodate soldiers outfitted  
100 with combat gear (i.e. Load Bearing Equipment (LBE) and flack vest, Mounted  
101 Warrior Soldier System (MWSS), etc.) and/or Mission Oriented Protective  
102 Posture IV (MOPP IV) equipment to include headgear.

103 **Primary Crew Seats.** The FTTS-MSV shall have at least two primary crew  
104 seats (Threshold) (four primary crew seats - Objective), which are ergonomically  
105 designed to provide leg, back, shoulder, and head support. The driver's seat  
106 shall be adjustable to accommodate 5<sup>th</sup> to 95<sup>th</sup> percentile soldiers.

107 **Rationale:** Ergonomically designed seats are needed to combat driver  
108 fatigue and support extended tactical operations. The Objective four-seat  
109 configuration permits transporting four-soldiers with their modular system without  
110 the need for an extra vehicle. An adjustable driver's seat is needed to  
111 accommodate the variation in sizes of the potential military drivers.

112 **Secondary Crew Seating.** Seating for at least two additional soldiers shall be  
113 provided for use in such missions as command and control and radio relay  
114 operations. The seating shall be separately foldable flush into the deck or

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

115 sidewalls of the cab. This seating shall be ergonomically designed to provide  
116 leg, back, shoulder, and head support.

117 **Rationale.** Four personnel may be required for transported module  
118 operation; therefore, seating for at least two additional soldiers is required. The  
119 FTTS-MSV is expected to perform a wide range of missions; therefore, seating  
120 which folds into the deck is needed to permit ease of vehicle reconfiguration and  
121 maximizing cargo deck space while still retaining the seats on the vehicle for  
122 future use and separately foldable increases flexibility. The ergonomically  
123 designed seats are needed to increase the potential for the occupants arrive at  
124 destination in a combat ready state.

125 **Crew Compartment Operating Environment.** The FTTS-MSV shall have  
126 internal environmental control measures to ensure personnel can work in the  
127 vehicle for extended periods of time. For systems with the crew compartment  
128 protection kit installed cab-cooling requirements shall be met with windows  
129 closed. (A kit may be used to meet this requirement. If a kit is used, it shall be  
130 installed at field level or below.)

131 **Rationale.** This vehicle will be operated throughout the world as  
132 exigencies dictate. The FTTS-MSV crew may be required to perform in  
133 temperatures as high as 120 degrees F and as low as -50 degrees F. Prolonged  
134 exposure to these temperatures can cause extreme fatigue and or permanent  
135 physical injury. The FTTS-MSV needs to allow for sustained operations in  
136 daylight and darkness and while the crewmembers are wearing MOPP IV gear  
137 (10 hours of continuous operation) to ensure that the crew of the FTTS-MSV  
138 remains mission capable. When the armor protection is installed, windows must  
139 be kept closed to maintain ballistic protection; hence, the need for cab cooling  
140 with windows closed. Use of a kit to provide a safe and comfortable cab-  
141 operating environment may be more cost effective than equipping all vehicles  
142 with this capability from the factory.

143 **Vehicle Control Enhancement.** The FTTS-MSV shall include active and  
144 passive vehicle control enhancements (e.g., integrated seat and restraint  
145 systems, improved brakes, traction control, etc.) that provide for maximum  
146 control of the vehicle during the full range of vehicle mission profile to include off-  
147 road use and emergency conditions. These enhancements shall also allow the  
148 FTTS-MSV to exhibit safe stability and handling characteristics at all speeds, up  
149 to and including maximum speed, during normal and emergency lane change  
150 maneuvers.

151 **Rationale.** Control enhancements provide for safer operation of the vehicle  
152 when operated closer to the design limits of the FTTS-MSV. This will provide for  
153 a more safe, effective, and efficient vehicle when operated across the mission  
154 terrain profile. Also, it is expected that the FTTS-MSV will be operated on public

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

155 highways around the world where lane change operations at varying speeds will  
156 be a routine occurrence. Additionally, emergency conditions may require rapid  
157 lane change corrections. Army drivers of all levels of experience and training  
158 backgrounds will drive the FTTS-MSV; therefore, the vehicle must not exhibit any  
159 unusual or unsafe characteristics.

160 **Vehicle Security.** The FTTS-MSV shall have a means to provide vehicle  
161 security (e.g., door locks, locking hatches and fuel tanks, etc.). The security  
162 system shall provide the capability to lock the entry points from inside the vehicle  
163 without inhibiting a quick exit from the vehicle. When the FTTS-MSV is locked  
164 from the outside, it shall be in compliance with requirements for securing  
165 communications equipment when vehicle is unattended, but shall not inhibit quick  
166 exit from the inside.

167 **Rationale.** Vehicle security is needed to prevent unauthorized access to  
168 the interior of the vehicle during operations while allowing rapid exit of the  
169 occupants in the event of an emergency. Vehicle security is also required to  
170 prevent unauthorized access to vehicle equipment when vehicle is unattended.

171 **Operations Using Arctic and MOPP IV Clothing.** While wearing individual  
172 arctic protective clothing and MOPP IV protective gear, under anticipated  
173 operational conditions, the crew and maintainers shall be able to conduct safe,  
174 effective, and efficient operations and maintenance on the vehicle, with or without  
175 towed loads.

176 **Rationale.** The FTTS-MSV will be subject to use in a wide variety of  
177 weather and tactical conditions. Soldiers must be capable of operating and  
178 maintaining the vehicle while wearing cold weather and NBC protective clothing.

179 **Load Towing Characteristics.**

180 **Companion Trailer Towing.** The FTTS-MSV shall be capable of safely towing,  
181 over the FTTS-MSV OMS/MP, the FTTS-MSV companion trailer described in  
182 Annex \_\_\_\_.

183 **Rationale.** The FTTS-MSV needs to be able to safely tow the companion  
184 trailer to ensure all UA systems using an FTTS-MSV trailer as an Associated  
185 Support Item of Equipment (ASIOE) can be relocated on the future battlefield.

186 **Backward Compatibility.** The FTTS-MSV shall be able to safely tow legacy  
187 trailers over the FTTS-MSV OMS/MP. Achieved speeds of the FTTS-MSV and  
188 towed system combination shall be equal to or greater than those achieved by  
189 the predecessor TWV and the same towed system.

190 **Rationale.** The FTTS-MSV must be backward compatible with the  
191 existing towed loads to ensure all mission-required equipment will be adequately  
192 supported on the future battlefield. It is recognized that such operation may

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

193 result in reduced FTTS-MSV performance level to be compatible with the towed  
194 load.

195 **Towed Load Brake Control.** When applicable, the FTTS-MSV shall have the  
196 capability for positive control of towed system brakes.

197 **Rationale:** Future military trailers/towed weapons systems that operate in  
198 both directions are expected to have positive braking systems to avoid mobility  
199 degradation and safety hazards caused by surge brakes. This requirement will  
200 ensure future compatibility.

201 **Towed Load Power and Control.** When applicable, the FTTS-MSV shall be  
202 capable of providing power and active control of the towed load.

203 **Rationale:** Future military trailers/towed weapons systems may have  
204 integral motors that provide enhanced off-road mobility. This requirement will  
205 ensure compatibility with this type system.

206 **Second Pintle.** The FTTS-MSV shall have the capability to mount a second  
207 pintle on the front of the vehicle. The pintle may be demountable for use on both  
208 front and rear of the vehicle.

209 **Rationale:** A front mounted pintle is needed to facilitate combat loading  
210 of trailers/ howitzers in U.S. Air Force aircraft and to provide ease of  
211 trailer/howitzer emplacement in field positions, aircraft relocation on the airfield,  
212 and relocation of trailers in ship holds.

213

214 **FTTS MSV (Wrecker) module** (Annex B) shall retain the same lifting and towing  
215 capability as any variant of the HEMTT wrecker and shall be able to tow/recover  
216 any variant of the FCS, IAV, HEMTT, PLS, FMTV, HMMWV, M915 family, M939  
217 family (to include M931 and M932 variants) from either the fore or aft or at a side  
218 angle not to exceed 60%.

219 **MSV 5<sup>th</sup> wheel module** (Annex C) shall tow a semi-trailer (weight TBD) with up  
220 to 40 ST payload.

221 **Rationale:** The FTTS will interface with current and interim force  
222 equipment and will replace the HEMTT in Objective Force units. It must retain  
223  same capabilities as the equipment it replaces.

224 **C4I**

225 **FTTS on-board information system** must provide all manned systems the   
226 ability to integrate into a joint, secure, network system from alert through  
227 deployment to employment and and be able to connect into the gaining  
228 command's C4ISR architectures during movement by air, land and sea. The  
229 system must interface with the CROP and Defense Transportation System (DTS)

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

230 to allow the Joint Task Force (JTF) to adjust responsiveness and adapt to a  
231 dynamic Joint Operational Area (JOA).

232 **Rationale:** Supports mission planning, mission rehearsal, battle command,  
233 and ability to integrate into gaining C2 architectures during movement by air, land  
234 and sea.

235 **Systems PMs** shall integrate with the Common Relevant Operating Picture  
236 (CROP) via embedded C4I equipment on the FTTS-MSV to include different  
237 types of suites, architectures, network peripherals, subsystems, and radios. The  
238 FTTS-MSV shall have sufficient space and power for on-board integration of  
239 C4ISR systems without inhibiting any vehicle operation by any operator within  
240 the cab space of the FTTS-MSV (to include line of sight, safety issues,  
241 MANPRINT, ergonomics, etc...) or without using room dedicated for TA-50,  
242 individual weapons, rucksack/backpack storage, crew gear, duffle bags, or other  
243 cab occupant belongings.

244 **Rationale:** Network centrality is an underlying principal of the Objective  
245 Force.

246 **Signature management.** FTTS-MSV shall have onboard signature  
247 management to counter the enemy's ability to acquire and engage our forces.  
248 They must have passive and active survivability capabilities to detect and counter  
249 an enemy's acoustic, visual, and electromagnetic acquisition means.

250 **Rationale:** The FTTS-MSV must have the same signature management  
251 capabilities as the forces it supports. Tactical formations must be able to move  
252 to positions of advantage without detection or degradation to combat operations.  
253 Platform survivability is directly related to the ability of the threat to detect the  
254 platform using a wide array of detection sensors. Optimization of signature  
255 management capabilities mizes system protection.

#### 256 **Deployability**

257 The FTTS-MSV and its companion trailer shall be transportable worldwide  
258 without disassembly and without shoring at its gross combined weight (GCW) by  
259 highway, rail, water, and air modes up to the allowable payload and dimensional  
260 limits of each respective transport carrier without waivers. When transported at  
261 GCWR, the trailer with load or empty will stay connected to the prime mover with  
262 load or empty as the situation allows.

263 **Rationale:** Increases the options available to the Combatant Commander  
264 for entering  into theater and maximizes force flow using multiple entry  
265 points to bring  combat configured units, enabling responsive operational and  
266 tactical movement and maneuver insupport of distributed operations. This  
267 capability improves not only our entry capability  also the continued flow of

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

268 forces later in the campaign for decisive operations. Transporting the FTTS-MSV  
269 and its companion trailer with a maximum payload will decrease the number of  
270 trucks and/or supply loads needed to accomplish a mission.

271 One FTTS-MSV or its companion trailer shall roll on-roll off under its own power  
272 onto a C-130 (any model) or C-130 like aircraft with up to and including a 6 ST  
273 payload and without the GVW exceeding 18 ST. Four at GVW or two at GCW  
274 shall be transportable without disassembly and without shoring and shall roll on-  
275 roll off under its own power aboard a C-17 (any model). Eight at GVW or four at  
276 GCW shall be transportable without disassembly and without shoring and shall  
277 roll on-roll off under its own power aboard a C-5 (any model). All FTTS-MSV and  
278 companion trailers shall be certified for air transport without waiver.

279 **Rationale:** Six short tons is half the projected gross combined platform  
280  eight of the Modular Platform System (MPS). By not exceeding 16 ST at GVW,  
281 the C-130's range will be maximized to a 1,000 nautical miles with enough fuel to  
282 jump an additional 250 miles to a refuel point. Preclusion of waivers decreases  
283 preparation time needed to make the FTTS-MSV air transportable.

284 The FTTS MSV must be transportable up to 750 NM (threshold) 1000 NM  
285 (Objective) by C-130 profile aircraft IAW MTMC/TEA C-130 White Paper dated  
286 11 Sep 02. Once off loaded, the FTTS must be capable of rapid transition to Full  
287 Combat Configuration missions postures with Objective operational range  
288 capability.

289 **Rationale:** C-130 deployment ensures the Combatant Commander's  
290 operational mobility, flexibility, and agility by increasing inter and intra-theater  
291 mobility options and enabling responsive operational and tactical movement and  
292 maneuver in support of distributed operations.

293  FTTS-MSV and its payload shall not require more than 15 total minutes to  
294 prepare for embarkation or debarkation on any form of transport (air, land, or  
295 sea).

296 **Rationale:** The Unit of Action will rely on unit integrity and rely less on  
297 lengthy embarkation/debarkation time when deploying to an Area of Operation.  
298 The FTTS-MSV can not cause combat ineffectiveness due to increased prep  
299 time or time due for mission configuration/re-configuration.

300 The FTTS-MSV and its companion trailer shall be deployable on participating  
301 VISA ships.

302  **Rationale:** VISA ships will be used to deploy forces and equipment when  
303 military or other government transportation means are not available.

304 **Transportability**

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

305 The FTTS-MSV and its companion trailer shall have sufficient and clearly marked  
306 non-removable lift and tie-down provisions able to support the lifting or tie-down  
307 of the FTTS-MSV at GVW on any acceptable means of transport (i.e. ship,  
308 aircraft, trailer, railcar, etc...) and without use of special lifting slings or tie-down  
309 devices.

310 **Rationale:** The FTTS-MSV and its companion trailer may be loaded with  
311 maximum payload when transported or moved via lifting. Clearly marked points  
312 will allow workers to identify correct points on the FTTS-MSV and companion  
313 trailer to use, thereby precluding unnecessary damage while transporting the  
314 FTTS-MSV and companion trailer.

315 The FTTS-MSV and its companion trailer shall have sufficient provisions for  
316 securing any payload on itself (including LHS payloads) up to and including 13  
317 ST for transport on any acceptable means of transport (i.e. ship, aircraft, trailer,  
318 railcar, etc...).

319 **Rationale:** The FTTS-MSV will be transported with a variety of loads up to  
320 and including 13 ST dependant on the maximum payload capability of the  
321 transporting system.

322 The FTTS-MSV shall at GCW and GVW negotiate a 15 degree approach angle  
323 and break-over (departure) angle without overloading axle or floor loads both  
324 forwards and backwards while egressing / ingressing without need for specials  
325 ramps, blocking or bracing, or other dunnage and without any part of the FTTS-  
326 MSV or trailer except for the tires touching the ground, ramp or compartment  
327 (cargo) area/floor.

328 **Rationale:** The FTTS-MSV and companion trailer will be transported on  
329 ships and aircraft with ramp angles up to and including 15 degrees. Preclusion  
330 of dunnage or other materiel expedites the embarkment/debarkment time.

331 C-130 Logistics Rails. At no time during loading, flight, or off loading shall any  
332 portion of the FTTS-MSV vehicle make contact with the C-130's logistics rails.

333 **Rationale:** If the FTTS-MSV were to contact the rail system, damage  
334 could be done to the FTTS-MSV or the rails and make either non-mission  
335 capable.

336 The FTTS-MSV and its companion trailer shall not require overweight/over  
337 dimensional permits either when operated as a self-propelled vehicle or when  
338 carried as cargo by ground transportation assets in the United States, NATO  
339 countries, or other allied/ host nations.

340 **Rationale:** The FTTS-MSV and its companion trailer will be used in  
341 Operations Other Than War (OOTW). By precluding permits for over-the-road  
342 movement, increased flexibility is given to the commander to move the FTTS-

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

343 MSV across varying lines of communication to ensure maximum transportation  
344 flexibility.

345 **Surface Transport.** The FTTS-MSV at GCW, GVW, and CW and the FTTS-  
346 MSV companion trailer at GVW and CW shall:

347 Meet highway legal limits, without waivers or special permits, for all countries in  
348 which the FTTS-MSV will be operated (current military installations and  
349 deployment sites both stateside and abroad).

350 Have military standard lifting and tie-down provisions to allow for loading and  
351 securing on all authorized means of transport.

352 Be rail transportable worldwide. Rail transport at GCW shall be performed with  
353 the towed load coupled to the FTTS-MSV.

354 Be marine transportable by LCM-8, and larger vessels/ships to include RO/RO  
355 vessels.

356 **Rationale.** All vehicles must adhere to highway legal load limits, vehicle size  
357 restrictions, and towed load restrictions, wherever they may operate to eliminate  
358 need to obtain special permits. Military standard lifting and tie-down provisions  
359 are essential for safe and efficient shipping of the FTTS-MSV and its companion  
360 trailer by rail, sea, and air. Transport by LCM-8, and larger vessels/ships is  
361 required for Logistics Over-the-Shore operations (LOTS). The RO/RO vessel  
362 compatibility is needed to permit worldwide shipment.

#### 363 **Agility**

364 Ride Quality. The FTTS-MSV shall meet the ride quality requirements at GVW  
365 and CW plus 2 occupants.

366 Ride Limiting Speed. The FTTS-MSV shall attain no more than 6 watts average  
367 vertical absorbed power, as measured at the occupants' location as well as the  
368 entire cargo compartment of the FTTS-MSV and its companion trailer, while  
369 negotiating the following Root Mean Square (RMS) ride courses at speeds listed  
370 below, with the tires at normal tire pressure (cross-country tire pressure, if  
371 equipped with a Central Tire Inflation System [CTIS]).

#### 372 **232 6-Watt Speeds (MPH)**

373

Version	RMS (inches)			
	1.0	1.5	2.0	2.5
GVW	30	20	15	13
CW plus 2 Occupants	25	18	13	11

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

374

375 Vertical Acceleration. The FTTS-MSV shall sustain no more than \_\_\_-G peak  
376 vertical acceleration, as measured at the occupants' location as well as the entire  
377 cargo compartment of the FTTS-MSV and its companion trailer, while negotiating  
378 a non-deformable, half-round obstacle at the rated speed as listed below with the  
379 tires at normal tire pressure (cross-country tire pressure, if equipped with a  
380 CTIS).

381

#### Obstacle Crossing Speeds (MPH)

382

Version	Obstacle Height (inches)			
	4	6	8	10
GVW	50	16	15	5
CW plus 2 Occupants	45	18	15	10

383

384 **Rationale:** Needed to provide a ride quality that permits continuous  
385 operations in most areas without serious detrimental effect on the occupants and  
386 equipment.

387 The FTTS-MSV shall negotiate a three-point turn within a 50-foot wide well deck  
388 or a single point turn within 80-foot wide (Threshold) 72-foot wide (Objective)  
389 TSV cargo hold area.

390 **Rationale:** The FTTS-MSV will be located in cargo holds of ships with  
391 little turning room and must allow expediency in turning or negotiating within the  
392 hold.

393 The FTTS-MSV at GVWR shall be capable of stepping up and down a vertical  
394 obstacle of 32 inches in forward and reverse without preparation or modification  
395 of the vehicle.

396 **Rationale:** In order to assure operational momentum, support systems  
397 require mobility capability equal to supported system.

398 The FTTS-MSV shall allow the operator to safely control the vehicle in the event  
399 of sudden power loss.

400 **Rationale:** Steering and braking capability not dependent on a powered  
401 system will give the operator the capability to safely control the vehicle.

402 The FTTS-MSV and its companion trailer shall ford a 48" (Threshold) or 60"  
403 (Objective) deep water obstacle without preparation, special kits, or other fording  
404 device in forward and reverse while maintaining contact with the ground.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

405 **Rationale:** Provides operational flexibility to maneuver over a wide variety  
406 of terrain and natural water obstacles. Reduces the need for integral or  
407 augmented engineer mobility support assets.

408 FTTS-MSV must be capable of traveling on a hard surface road that has no more  
409 than +2% grade at sustained speeds of 90kph.

410 **Rationale:** Permits sustained speeds for movement by road of operational  
411 distances. Enables sustainment of combat forces at a time, place and method of  
412 our choosing. Supports decisive maneuver.

413 **Rationale:** Required to provide additional survivability to soldiers  
414 facilitating agile movements to destroy enemy forces or avoid engagements.  
415 Dash speed is based on known threats, engagement ranges, and time of flight  
416 for anti-tank guided missiles (ATGMs).

417 FTTS-MSV must be capable of traveling cross-country at sustained speeds of  
418 50kph.

419 **Rationale:** Supports decisive maneuver, and provides critical freedom of action,  
420 high tempo and velocity. Support systems require mobility capability equal to  
421 supported systems.

422 **Range.** The FTTS-MSV shall be capable of operating on internally carried fuel  
423 for a minimum distance of at least 600 miles (T), 900 miles (O), at GCW across  
424 the OMS/MP. Internally carried fuel includes all fuel tanks at no more than 95  
425 percent full, with 5 percent allowed for ullage.

426 **Rationale.** The range will ensure that the FTTS-MSV has the ability to  
427 sustain itself for 72 hours without resupply in a high intensity battle and another  
428 four days in a low intensity environment and maintain momentum with the UA on  
429 the battlefield.

430 The FTTS-MSV at GVW must be capable of crossing trenches with a width of no  
431 less than 59 inches in forward and reverse without preparation.

432 **Rationale:** The FTTS-MSV and its companion trailer must be able to  
433 cross trenches without additional mobility support augmentation in order to  
434 preserve operational momentum. This trench crossing capability will allow for the  
435 FTTS-MSV to cross approximately 30% of known gaps in the world based on  
436 current gap crossing studies.

437 **Slopes.**

438 FTTS-MSV from CW to GCW shall be capable of climbing and descending  
439 in forward and reverse a longitudinal 60 percent dry hard surface slope with no  
440 degradation in steering.

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

441 **Rationale:** This allows the platform to negotiate steep hills, valleys, and  
442 man-made objects that are typical in cross-country and urban terrain.

443 The FTTS-MSV from CW to GCW shall be capable of holding in either direction  
444 on a 30-percent longitudinal slope using only the parking brake with the engine  
445 off and the transmission in neutral. Longitudinal slope operation shall be  
446 performed in both ascending and descending directions without loss of stability,  
447 malfunction, or degradation of stated requirements.

448 **Rationale:** Adequate brakes are necessary for safe control on slopes.  
449 The ability to stop, park, and restart on longitudinal slopes is necessary to ensure  
450 adequacy of parking brakes and engine fuel and lubrication systems and to  
451 permit full operation on RO/RO vessels. Achievement of the Objective will allow  
452 for a safety margin during operations in rolling sea conditions where the angle  
453 may vary.

454 **Speed on Grade.** The FTTS-MSV and its companion trailer both at GCW shall  
455 be capable of ascending a 5-percent grade at 55 MPH (Threshold) (60 MPH –  
456 Objective):

457 **Rationale.** Meeting this requirement ensures adequate motive power for  
458 operations in hilly to mountainous terrain and is in consonance with the  
459 capabilities of predecessor vehicles. Achievement of the Objective speeds will  
460 increase the combat effectiveness of the unit as the assets are relocated on the  
461 battlefield.

462 The FTTS-MSV from CW to GCW shall be capable of traversing a dry hard  
463 surface side slope up to and including 40 percent. Side slope operation shall be  
464 performed with either side of the vehicle facing up slope and without loss of  
465 stability or malfunction/degradation of stated requirements or loss of vehicle  
466 fluids.

467 **Rationale:** Supports the concept of assured mobility. Support systems  
468 require mobility capability equal to supported systems. Thirty percent is the  
469 standard for military vehicles traversing side slopes. With the variety of worldwide  
470 deployment locations, operations with side slopes up to 30 percent will be  
471 encountered. Negotiating these slopes is essential for overall battlefield  
472 maneuverability.

473 The FTTS-MSV and its companion trailer shall be capable of being recovered/lift  
474 and flat-towed from both the front (at GCW) and rear (at GCW) with no  
475 disassembly required. Normal preparation may consist of attaching electrical  
476 whip, tow bar attachments, and air lines.

477 **Rationale:** Ensures the FTTS-MSV can be recovered and evacuated by  
478 Army wheeled wreckers..

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

479 Tow Eyes. Tow eyes on the FTTS-MSV must be of sufficient strength to  
480 withstand the maximum forces encountered while being used for towing and  
481 winch recovery operations.

482 **Rationale:** Towing eyes will be used for both towing and winch recovery  
483 operations; therefore, they must be of sufficient strength to be suitable for these  
484 operations.

485

#### 486 **Mission Profiles.**

487 Upon entry into the AO, FCS FoS (FTTS-MSV) combat units move over  
488 operational maneuver distances (up to 400 km) to designated area(s) of  
489 operation as a coherent, integrated combined arms team with the ability to  
490 conduct their core mission tasks. They will conduct operations with a combat  
491 radius of 75km.

492 **Rationale:** Current analysis and technology suggests that 750km combat  
493 range is possible at threshold. It is estimated that a 1000km operating range will  
494 satisfy the most extensive and challenging UA operations.

495  "FTTS-MSV Tactical Mobility" is defined as 30 percent improved roads (paved  
496 gravel) and 70 percent unimproved roads (trails) and cross-country. Cross-  
497 country includes beaches, forests, grasslands, tropical jungles, mountains, and  
498 deserts throughout all seasonal conditions

499

<u>Road Surface</u>	<u>Terrain</u>	<u>% Operation</u>	<u>*RMS Range</u>
Improved	Hard Surfaced	10	0.1" - 0.3"
	Gravel	20	0.3" - 1.0"
Unimproved	Trails	30	1.0" - 3.4"
	Cross-country	40	1.5" - 4.8"

500 \* Root Mean Squared (RMS) is a measure of surface and terrain  
501 roughness used to evaluate trafficability.

502 **Rationale:** Operational Mode Summary/Mission Profile

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

503 **Versatility**

504 FTTS-MSV shall have sensors which collect and transmit fuel on-board, rounds  
505 remaining, potable water on-board, and rations on-board.

506 **Rationale:** For notification of out-of-cycle resupply, cross-leveling and  
507 reduces sustainment requirements

508 FTTS-MSV shall be compatible with standard common support equipment for  
509 refueling, rearming, resupply, servicing, and material handling.

510 **Rationale:** Standardize support equipment

511 Ammunition Certification: The FTTS-MSV and its companion trailer shall be  
512 certified for ammunition transport.

513 **Rationale:** FTTS-MSV will be the primary ammunition distribution vehicle

514 **Electrical Components.** The FTTS-MSV shall have the following electrical  
515 components:

516 NATO electrical slave receptacle with electrical capability to jump-start vehicles  
517 with 24 volt starting systems.

518 **Rationale.** The incorporation of NATO electrical slave receptacles is  
519 needed for starting disabled vehicles on the battlefield.

520 Secure lighting and blackout drive.

521 **Rationale.** Required for operations in night combat environments.

522 Basic electrical outlet (to include on/off switch) in the crew compartment for 12  
523 volt Direct Current (DC) and 24 volt DC, supplemental power for plugging in  
524 electrically operated devices (e.g., hand held radio and MWSS battery chargers,  
525 computers, flashing warning lights, mounted water ration heater, etc.).

526 **Rationale.** Vehicle integrated dual power sources are required to permit  
527 rapid installation of ancillary equipment needed for mission accomplishment.

528 Electrical power source outlets 12 and 24 volt outlets in the cargo compartment  
529 with minimum interference with the cargo (110v AC).

530 **Rationale.** Required to facilitate quick hook-up of systems with which the  
531 FTTS-MSV will be associated and that require vehicle provided electrical power  
532 delivered to the cargo area.

533 **Vehicle Electric Power Source.**

534 A 28 Volts DC power source of at least a 200 amperes delivered output at  
535 vehicle engine idle speed. A 400 amperes power source kit shall be made  
536 available for systems requiring more than the basic 200 amperes. Systems

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

537 requiring more than 400 amperes must provide their own additional power source  
538 (i.e., add-on alternator or generator, or a separate generator).

539 A 120 Volts AC power source of at least 2500 watts continuous delivered output  
540 at vehicle engine idle speed provided integral to the vehicle to include associated  
541 electrical outlets and power distribution components.

542 **Rationale.** Required to support individual vehicle mission requirements and  
543 to augment the power as necessary to support present and emerging systems  
544 requiring electricity. In addition, some current Signal systems require up to 400  
545 amperes of DC power. By requiring a 400-ampere kit, the integration of power  
546 source and truck will be considered at the beginning of the program. Upgraded  
547 power sources are required to produce sufficient output power for the varied  
548 systems located in the various shelters and present and emerging Combat-Net  
549 Radios (CNR) without degrading the vehicle's operating capabilities. Requiring  
550 the 200-ampere DC and 2500-watt AC output at vehicle engine idle speed  
551 extends battery life by maintaining a full charge and reduces the probability of the  
552 engine overheating. Overheating can occur when operating the engine for long  
553 periods of time at high idle, as when on radio watch for extended periods. .  
554 Integrating access to AC power on-board the vehicle increases capability,  
555 deployability, and mobility. Furthermore, low idle output conserves fuel and  
556 reduces vehicle signature. The responsibility to provide additional power over  
557 400 amperes must rest with the developer of the system requiring the added  
558 power. The FTTS-MSV may have to accept an add-on alternator or some other  
559 power generation source to meet this requirement. Since the requirement for  
560 2500-watt AC is generally limited to mission specific roles, a kit to provide AC is  
561 acceptable.

562 Power storage devices shall be of sufficient power to power the vehicle and  
563 perform electrical requirements in all climatic conditions and shall be  
564 maintenance free.

565 **Rationale.** Mature power storage performance characteristics are basic to  
566 electrical system design. The maintenance-free characteristic is needed to  
567 reduce battery care and maintenance required in the field and need to start the  
568 vehicle in all types of weather and power storage must be maintenance free.

569 The vehicle electrical charging system shall include temperature-compensated  
570 voltage regulation, using temperature sensing within the battery compartment, to  
571 optimize battery charging.

572 **Rationale.** Temperature-compensated voltage regulation will optimize  
573 battery charging, improve battery life in extreme climates, and permit use of  
574 future advanced technology vehicle batteries. The vehicle temperature  
575 performance requirements, the “steady state voltage” design limitations of 25V-

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

576 30V DC, and performance input from commercial battery manufacturers will  
577 provide sufficient design guidance to the contractor to accomplish this task.

578 **Ancillary Electronic Equipment.** The FTTS-MSV shall accommodate the  
579 integration of and provide power and space for: i.e. Movement Tracking System  
580 (MTS)/Force XXI Battle Command-Brigade and Below (FBCB2), Driver Vision  
581 Enhancement (DVE) system, GPS, Light Vehicle Obscuration Smoke System  
582 (LVOSS), Maneuver Control System (MCS), NBC M8 Alarm or its replacement,  
583 and Identification Friend/Foe (IFF) systems. All of these systems shall be  
584 operated/used by the crew directly from the cab without interfering with vehicle  
585 operations while vehicle is in motion. Under-the-floorboard conduit shall also be  
586 placed in the vehicle for use in wiring future systems that may be mounted on the  
587 FTTS-MSV. Power supplied for these systems is in addition to vehicle-required  
588 power.

589 **Rationale.** The ability to quickly and easily mount/dismount present and  
590 emerging technologies is tied directly to the employment of the FTTS-MSV.  
591 Communications/ electronics must be considered in the design of the vehicle to  
592 ensure adequate space and wiring are available and equipment can be crew  
593 operated while the vehicle is in motion. Vehicle structure/body must be strong  
594 enough to accommodate these systems. Future systems may require  
595 connectivity between the back and front passenger seats and to other onboard  
596 systems. Planning ahead for cable routing that will not clutter the interior space  
597 will preclude problems. Once these items have been integrated into the vehicle,  
598 the vehicle must still have enough power to operate and perform its missions.

599 **Extended Electrical Capability/Capacity.** When applicable, vehicle power  
600 generation and management shall be provided to power weapons systems, Army  
601 Battle Command System (ABCS), and/or support systems and to recharge  
602 MWSS equipment by providing at least 30 kilowatts (kW) (Threshold) (50kW  
603 Objective) of AC for internal and external operational power demands. Cost of  
604 kits, upgrades and distribution systems shall be born by the program for the  
605 associated weapon or support system.

606 **Rationale.** The incorporation of managed AC electric power provisions is  
607 needed to support current and emerging digitization efforts involving Command,  
608 Control, Communications, and Computers (C4); intelligence; weapons; Standard  
609 Integrated Command Post Shelters (SICPS); and maintenance systems. This  
610 capability has the potential to streamline the deployment of Tactical Operation  
611 Centers (TOC) and other high energy demanding systems by reducing or  
612 eliminating the need for towed generator sets through the application of  
613 alternative power generation capabilities (e.g., hybrid energy technology).

614 **Night Vision Device Compatibility.** Lighting, instrumentation, and windshield in  
615 the crew compartment shall be compatible with the latest generation of night

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

616 vision devices. Windshield tinting shall not reduce visibility when using night  
617 vision devices.

618 **Rationale.** Night vision devices use light intensification and are easily  
619 overloaded and subsequently damaged by excessive light. Providing light in the  
620 proper spectrum and intensity will eliminate this damage. Certain windshield  
621 tinting can reduce visibility when using night vision devices and must be  
622 considered in the design of the vehicle. The FTTS-MSV must provide complete  
623 blackout driving as well as the ability for co-driver to see the speedometer and  
624 other instruments when driving with the monocular goggle. Since the  
625 requirement for no aural detection is specified as that achieved by the current  
626 HMMWV, the visual detection at night should be at least as good.

627 **Mounting Points.** The FTTS-MSV shall have mounting points (fore, aft, and  
628 external) and power connections where required, capable of mounting  
629 telephones, computers, antennas, mounted water ration heater, camouflage  
630 netting (externally), NATO bridge classification placards, flashing warning beacon  
631 kit, and mounting brackets for standard Army fuel/water containers.

632 **Rationale.** The ability to quickly and easily mount/dismount  
633 communications/ electronics and other equipment is tied directly to the  
634 employment of the FTTS-MSV and must be considered in the placement of  
635 mounting points on the vehicle to ensure adequate strength, space, and wiring  
636 are available when the equipment is mounted.

637 **Potable Water.**

638 **Water Generation.** The FTTS-Variants shall incorporate an embedded potable  
639 water generation and storage capability that allows the FTTS-Variants and  
640 assigned operator/crew to operate without external water re-supply for a period  
641 of 3 days of high intensity or 7 days of low intensity operations.

642 **Rationale:** The FTTS-Variants embedded water production capability is  
643 needed to enhance flexibility of supply operations, minimize need for special  
644 purpose water units and demands, and increases available combat power

645 **Captured Water from AC Unit.** All condensation from AC unit shall be captured  
646 and recycled.

647 **Rationale.** All condensation on the AC pipes is potable water and should  
648 be captured to ensure conservation and collection of all available water.

649 **Environmental Conditions.**

650 The FTTS-MSV and its companion trailer must successfully perform all functions  
651 in all climates geographic areas, and environmental conditions.

652 **Rationale:** UA forces expected to be employed worldwide

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

653 The FTTS-MSV shall be able to start and operate in temperatures from -25° to  
654 125° F without special kits, maintaining full mission capability (threshold) and –  
655 25° F to –50° F with special kits while maintaining 90 per cent mission capability  
656 (objective). The vehicle must start and attain operating temperatures in extreme  
657 cold in no more than 30 minutes (threshold).

658 **Rationale:** UA forces expected to be employed worldwide

659 The FTTS-MSV and its companion trailer must be capable of being placed in  
660 storage at temperatures ranging between –60° F and 160° F without degradation.

661 **Rationale:** Support of future contingency will be dependant upon forward  
662 storage

#### 663 **Recovery and Evacuation Operations.**

664 **Like-Vehicle Towing.** The FTTS-MSV at GVW shall be capable of towing any  
665 other FTTS-MSV at GVW (Threshold) (GCW – Objective) over the FTTS-MSV  
666 mission terrain profile. Reduced speed of 15 percent for this operation is  
667 acceptable.

668 **Rationale.** To permit evacuation of one FTTS-MSV by another FTTS-MSV  
669 during periods when standard recovery vehicles are in short supply on the  
670 battlefield.

671 Each FTTS-MSV must retain sufficient mobility in degraded mode to continue the  
672 operation or move to a combat repair location. (Threshold/Objective).

673 **Rationale:** Reduces requirement for recovery assets. A mobility degraded  
674 mode is when a vehicle suffers a mobility injury, such as a damaged wheel from  
675 a land mine, and driven on five of six or seven of eight wheels at a reduced  
676 speed to a sustainment area to be repaired.

677 The FTTS MSV and its companion trailer shall incorporate means to adjust tire  
678 pressure to increase cross country mobility. The FTTS-MSV shall incorporate  
679 this capability to allow the operator to adjust tire pressure

680 ○ From GVW to GCWR

681 ○ by axle

682 ○ For terrain conditions

683 The FTTS-MSV and its companion trailer shall have the capability to  
684 inflate/deflate while moving tire pressure from the hard surface pressure to sand  
685 pressure in 5 min.

686 **Rationale:** Improved mobility will be needed over a variety of terrains and in  
687 a variety of conditions. The FTTS-MSV must have near instantaneous capability  
688 to transition from hard surface to soft surface/austere conditions.

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

689 **Lethality.**

690 **Tactical Security.**

691 **Self-Defense Weapons.**

692 **Primary.** The FTTS-MSV shall have provisions for mounting self-defense  
693 weapons (e.g., M2, M240, M249, M60 Machine Gun, or MK-19 Grenade Machine  
694 Gun) with ammunition can (if required) on top of the vehicle. The mounting  
695 device shall permit operation of the weapon while traversing 360 degrees  
696 horizontally with little effort from the gunner and without interfering with other  
697 crew operations. Provision to enable the 5<sup>th</sup> to 95<sup>th</sup> percentile target audience  
698 soldier to operate the weapon (without interfering with other crew operations) is  
699 required. A mechanical traverse with a positive travel lock capability is required.  
700 The gunner shall be able to perform all crew service functions on the weapon  
701 while it is mounted in operating position. Spent brass and links shall not enter  
702 the crew compartment. The gunner shall be able to engage targets from within  
703 the crew compartment, as well as by a gunner positioned in a ring mount, if  
704 provided. (Characteristics for this capability are found in the approved Common  
705 Remotely Operated Weapon System (CROWS) ORD, dated 22 Apr 99.) If a full  
706 overhead crew compartment protection kit is installed, it is required that the  
707 weapon system be compatible with the platform. (Currently writing provisions for  
708 a dual weapons mount.)

709 **Rationale.** The FTTS-MSV will not always be able to rely on maneuver  
710 forces providing security. The FTTS-MSV is expected to make timely and  
711 accurate FCS UA supply deliveries in and near the forward area of the battle.  
712 The threat strategy will likely include the attrition of FCS supply assets. The  
713 ability to incorporate a self defense weapon able to protect the FTTS-MSV from  
714 the range of likely threats will increase the amount of supplies reaching the UA.  
715 Automatic weapons are essential for vehicle/crew defense against ground and air  
716 attacks and especially in urban environments during stability and support  
717 operations in which the vehicles may be forced to operate independently. The  
718 ability to traverse 360 degrees horizontally gives the gunner the mobility to  
719 acquire and engage targets from all directions. The weapon must be accessible  
720 to accommodate the variety of personnel that will operate the weapon. A  
721 mechanical traversing mechanism is needed to assist the operator to traverse his  
722 weapon when firing from the vehicle while it is on an incline. The positive travel  
723 lock is needed to prevent the weapon from freely rotating while underway. The  
724 requirement for the gunner to be able to perform all normal weapon functions  
725 with the weapon mounted is needed to ensure that there is sufficient space to  
726 perform such functions as weapons clearing and misfire corrective actions.  
727 Keeping spent brass and links out of the crew compartment is needed to prevent  
728 possible injury to the crew and to ensure there is no interference with vehicle

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

729 operations. The ability to operate these weapons from within the vehicle  
730 eliminates the need for the gunner to expose himself to fire.

731 **Gun Shield Kit.** A gun shield kit shall be provided for use with the primary  
732 weapon station and shall be able to defend against multiple hits from 7.62mm  
733 B32 Armor Piercing (AP) rounds or their equivalent. Protection shall be from  
734 rounds fired at 100 meters standoff range with no perforation when fired at 0-  
735 degrees obliquity horizontally over 0-360 degrees attack directions to the vehicle  
736 and to the roof area at 60-degrees obliquity. The gun shield shall be removable  
737 at the field level without special tools.

738 **Rationale.** The gun shield significantly enhances survivability for the  
739 weapons operator as he engages targets. Removal at field level will allow for  
740 quick reconfiguration of the system in a combat environment.

741 **Ammunition Storage.** Provisions shall be made for self-defense weapon  
742 ammunition storage that meet U.S. Army Defense Ammunition Center and  
743 School (USADACS) security certification requirements to transport ammunition  
744 over the vehicle mission profile. Storage provisions shall have a readily  
745 accessible quick release. Space allocations shall be provided for at least the  
746 following type and quantity of standard Army ammunition:

Ammunition Type	Quantity
M16	2 cans
M203	1 can
Mk-19, M2 or M60/M240	6 cans
M249	4 cans

747 **Rationale.** All ammunition transported on U.S. highways requires certified  
748 secured stowage to prevent spillage and damage in transit. The quick release is  
749 needed to permit quick access to the ammunition in the event of an attack. The  
750 quantities of ammunition indicated are required to support the mission.

751 Each FTTS-MSV must protect the crew from on-board self-defense weapon  
752 stored ammunition detonation and/or fuel fires to minimize crew casualties.  
753 Emergency evacuation procedures must not be impeded by having to move or  
754 relocate parts of the system.

755 **Rationale:** Detonation of on-board ammunition or on-board fire may result  
756 in death of occupants or catastrophic kill of the FTTS-MSV. Mechanical solutions  
757 that afford maximum protection to the crew and system will prevent loss of  
758 soldiers and materiel.

759

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

##### 760 **Survivability** .

761 Situational Awareness/Situational Understanding (SA/SU). The FTTS-MSV  
762 must interface with the Common Relevant Operating Picture (CroP).  
763 (Threshold/Objective) to ensure effective SA/SU.

764 **Rationale:** It is critical that the crew of the FTTS-MSV are provided  
765 accurate, timely SA concerning their immediate location to accomplish accurate  
766 and timely support operations to the FCS UA. Information such as threat  
767 locations, local security information, cleared routes, etc is critical, particularly for  
768 FTTS-MSV's providing supplies to maneuver forces in and around the forward  
769 area.

##### 770 **Crew Safety.**

771 Individual Weapons Stowage. The FTTS-MSV shall have readily accessible  
772 quick release, individual weapons stowage (for all versions of the M-16, Squad  
773 Automatic Weapon (SAW), M4 Carbine, M203, and the Objective Individual  
774 Combat Weapon (OICW)) for up to four soldiers (Threshold) without interfering  
775 with the operating functions, controls for vehicle operation, internal equipment  
776 controls, and entry/exit doors.

777 **Rationale:** The occupants' individual weapons must be readily accessible in  
778 the event of enemy contact but must be secured so as not to be missiles in event  
779 of an accident or rough cross-country operations and located so as to not  
780 interfere with internal vehicle operations.

781 Crew Restraint System. Each occupant seat shall have modern integrated  
782 safety restraint equipment, active/passive, that meets or exceeds Federal Motor  
783 Vehicle Safety Standards when operated over the full vehicle mission profile, to  
784 include off-road use, at rated speeds. This system shall accommodate a soldier  
785 wearing full combat gear (to include LBE, personal body armor, and protective  
786 mask) and individual MOPP IV protective gear without interfering with vehicle or  
787 crew operation.

788 **Rationale:** The restraint system must be designed to allow a combat ready  
789 soldier to operate the vehicle throughout the battlefield environment, to include  
790 NBC contaminated areas, without impact on operability of the vehicle.  
791 Integrating the personal restraint system into the seat provides a more thoroughly  
792 unified system that will enhance personnel convenience and usage as well as  
793 accommodate a wide variety of operator/crew sizes.

794 Survivable Space. The FTTS-MSV shall have a cab design that provides  
795 sufficient survivable space during an accident for four occupants in the seating  
796 areas

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

797       **Rationale:** Adequate cab protection is needed to prevent the occupants from  
798 being crushed in an otherwise survivable accident.

799       **NBC Protection:**

800 FTTS-MSV shall possess the capability to detect Nuclear Contamination. This  
801 warning will automatically populate the CROP.

802       **Rationale:** All UA/UE platforms will be capable of detecting nuclear  
803 contamination. This capability will increase element survivability as well as  
804 assisting the commander's avenue of approach decisions.

805       **Nuclear.** The critical functions of the FTTS-MSV shall survive the initial effects  
806 from nuclear weapons where at least one crewmember remains combat  
807 effective. The critical functions of the FTTS-MSV shall be High-Altitude  
808 Electromagnetic Pulse (HEMP) survivable. The FTTS-MSV does not have to  
809 operate through the HEMP event. Recycling power to restore operations after a  
810 HEMP event is acceptable. The critical functions of the FTTS-MSV are driving  
811 and providing power load and unload the payload. This includes vehicle  
812 subassemblies and component parts needed to accomplish these tasks.

813       **Rationale:** Provides maximum protection for the individual soldier and  
814 FTTS-MSV. Provides continuous operations capability eliminating the need for  
815 operational pauses.

816 HEMP survivability is required to ensure continuation of the vehicle mission and  
817 to return crew to reconstitution site subsequent to a nuclear detonation that is  
818 otherwise survivable. The inclusion of related vehicle subassemblies and  
819 component parts is required to ensure that replacement parts and future  
820 upgrades to vehicle components do not degrade or negate the performance of  
821 the approved FTTS-MSV configuration(s). In cases where the FTTS-MSV is a  
822 critical component of another system, it must survive initial nuclear weapon  
823 effects to the level directed by those systems.

824       **Biological.** FTTS-MSV shall possess the ability to detect and identify Biological  
825 Agents (Objective). This warning will automatically populate the CROP.

826       **Rationale:** The proliferation of biological agents throughout the world  
827 requires that the FTTS-MSV platforms and systems have the capability to detect  
828 and identify biological agents. This detection/identification capability ensures  
829 survivability during combat and non-combat operations.

830       **Chemical.** Each FTTS-MSV must possess a capability to detect chemical  
831 hazards (Threshold) prior to incapacitating dose time. This warning will  
832 automatically populate the CROP.

833       **Rationale:** This capability provides maximum protection at the individual  
834 Soldier level, both on a platform and on the ground. Provides continuous

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

835 operations capability eliminating the need for operational pauses. Supports a  
836 common situational understanding of the battlespace.

837 **Monitoring.** FTTS-MSV must be capable of monitoring personnel for  
838 contamination prior to entry of the vehicle (Threshold/Objective).

839 **Rationale:** Within the life cycle of the FTTS-MSV, threat forces can be  
840 expected to present full spectrum threats from highly effective short, medium,  
841 and long range precision and area weapons capable of delivering multi-purpose  
842 chemical; biological; nuclear and radiological payloads.

843 **Chemical Agent Resistant Coating (CARC).** FTTS-MSV must be hardened  
844 against agent absorption to preclude damage to the FTTS-MSV during  
845 decontamination operations. Hardening must be such that decontamination will  
846 cause no loss of platform functions that cannot be restored at organizational-level  
847 maintenance or with a replacement (Threshold)/no loss of platform functions  
848 (Objective). Also, the CARC will be able to be touched up without special  
849 equipment and monitoring requirements (Objective).

850 **Rationale:** Studies show that system effectiveness, unit operational  
851 performance, and command and control will be degraded if the  
852 Chemical/Biological hazard is not reduced.

853 The FTTS-MSV shall include the capability to decontaminate personnel and  
854 equipment (operational) by use of embedded decontamination systems to reduce  
855 Chemical, Biological, Radiological and Nuclear (CBRN) and HAZMAT hazards to  
856 negligible risk.

857 **Rationale:** Enhances soldier endurance and stamina to fight effectively under  
858 all operational and environmental conditions. Provide maximum protection at  
859 the individual Soldier level, both on a platform and on the ground. Reduces UA  
860 logistical footprint. Immediate decontamination prevents absorption by the FTTS.  
861 Studies show that weapon system effectiveness, unit operational performance,  
862 and command and control will be degraded if the CB hazard is not reduced.

863 The FTTS-MSV shall have a CBRN capability to sustain the crew without the use  
864 of individual protective over-garments and masks while operating in a CBRN  
865 environment for 6 hours (Threshold)/12 hours (Objective). The manned systems  
866 capability must allow for exiting the vehicle from one hatch without compromising  
867 crew safety to loss of protection.

868 **Rationale:** Enhances soldier endurance and stamina to fight effectively under  
869 all operational and environmental conditions. Provides continuous operations  
870 capability minimizing the need for tactical pauses until the situation allows hasty  
871 or deliberate decontamination, or preparation for increased individual MOPP  
872 status. Chem Bio excursions conducted in support of MANCEN Rock Drill 13-15  
873 Aug 02 demonstrated extensive reduction in soldier performance and

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

874 survivability in systems without overpressure.

875 Each FTTS manned system must possess a CBRN filtration system that  
876 interfaces with individual crew and passenger protective garments and  
877 equipment, to allow for continued operation with open hatches

878 **Rationale:** Enhances soldier endurance and stamina to fight effectively  
879 under all operational and environmental conditions. Provides continuous  
880 operations capability minimizing the need for tactical pauses until the situation  
881 allows hasty or deliberate decontamination, or preparation for increased  
882 individual MOPP status. There may be cases where overpressure system  
883 cannot be used. If contaminated soldiers must enter the vehicle or if the hatches  
884 must remain open for mission reasons, they need the option to hook up to the  
885 vehicle system and take filtered and conditioned air directly to their suites. CANE  
886 studies indicate performance reduction differences between collective protection  
887 (supplied air) and mask filter only.

888 FTTS manned systems must include an inside air quality monitoring capability for  
889 CBRN/TIC/TIM and carbon monoxide.

890 **Rationale:** Enhances soldier endurance and stamina to fight effectively  
891 under all operational and environmental conditions. Enables FTTS to pass  
892 through CBRN and TIC/TIM areas without significant mission degradation or loss  
893 of operational momentum. Overpressure and filtration systems do not protect  
894 from carbon monoxide and oxygen depleting environments. Without an internal  
895 indicator, there is no method of identifying such hazards before soldiers become  
896 casualties.

897 FTTS manned systems must include an indicator of collective protection system  
898 performance i.e. residual filter life.

899 **Rationale:** Standard filtration systems begin to degrade immediately  
900 upon installation. CBRN contamination increases the breakdown of the filter  
901 even at a negligible level. End of life can be unpredictable without an end of life  
902 indicator. Filter failure will force occupants to don individual protective gear and  
903 their performance will be degraded.

904 **Electromagnetic Interference (EMI).** The FTTS-MSV shall comply with  
905 applicable military EMI and electromagnetic emission susceptibility requirements,  
906 and commercial electromagnetic compatibility standards/recommendations as  
907 needed to support electronic engine, transmission, braking, CTIS controls, and  
908 other vehicle electronic components/controls.

909 **Rationale.** Compliance with these requirements (currently MIL-STD-461  
910 Requirements for the Control of Electromagnetic Interference Emissions and  
911 Susceptibility) is necessary for operational compatibility with other vehicles and  
912 equipment in a military environment. In addition, the application of electronic

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

913 controls to major system (Non-Developmental Item (NDI)/Commercial)  
914 components has necessitated additional design and performance controls to  
915 ensure mutual compatibility.

916 Crew Protection Protect the crew compartment occupants from the blast,  
917 fragments, and injurious acceleration (both vertical, to include the impact of the  
918 vehicle returning to the ground, and horizontal) effects of antipersonnel  
919 fragmentation mines (to include unexploded artillery sub-munitions -- minimum  
920 500 grams/1 pound explosive weight -- and Claymore type mines) and blast type  
921 antitank mines and other blast munitions such as grenades, bomblets, and  
922 mortar rounds used as mines (up to the equivalent of 12 pounds (Threshold) (16  
923 pounds – Objective) of TNT explosive weights), pressure detonated under the  
924 wheel station, with no fragmentation perforation and no significant crew  
925 compartment deformation or permanent debilitating injury to crew compartment  
926 occupants. Seats may be designed to attenuate some of the force from the mine  
927 blast. Protection provided by the design of the seat shall not degrade soldier  
928 comfort or ease of operation.

929 **Rationale:** This protection will enhance soldier survivability against mines  
930 and explosives in combat and peacekeeping environments.

931 Ballistic Protection. The FTTS-MSV shall provide integral crew protection in  
932 accordance with classified survivability annex (Threshold/Objective) See Annex  
933 XX.

934 **Rationale:** See Annex XX.

935 **Integral Ballistic Protection.** Each FTTS-MSV must provide ballistic protection  
936 (structural or add-on armor) to the crew in accordance with classified survivability  
937 annex (Threshold/Objective). See Annex XX.

938 **Rationale:** In the FCS support concept, support platforms may be  
939 required to supply in the forward area. Further, supply platforms must be able to  
940 come off tactical airlifters (e.g. C-130) with some level of integral ballistic  
941 protection so that they are immediately able to perform supply operations. This  
942 integral protection must also be designed in a way that makes additional ballistic  
943 protection upgrades (appliques) easy and effective.

944 **Supplemental Ballistic Protection.** Each FTTS-MSV must provide  
945 supplemental ballistic protection (applique armor) to the crew in accordance with  
946 classified survivability annex (Threshold/Objective). See Annex XX.

947 **Rationale:** In the FCS support concept, support platforms may be  
948 required to supply in the forward area. Contingent on the capability and tactics of  
949 the threat being engaged, the ability to have easily applied supplemental ballistic  
950 protection is required.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

951 **Crew Compartment Applique Protection Kit Maintenance.** The FTTS-MSV  
952 crew compartment protection kit shall require no maintenance beyond standard  
953 Preventive Maintenance Checks and Services (PMCS) performed by the  
954 operator using onboard tools. Easily replaceable parts shall permit unit level  
955 replacement of portions of the kit without special tools or unique skills.

956 **Rationale.** To reduce to a minimum the maintenance burden imposed on  
957 the unit and operator by installation of the protection kit or its components.

958 **Crew Compartment Applique Protection Kit Maintenance Vehicle Impact.**  
959 The crew compartment protection kit design shall not interfere with other  
960 maintenance operations of the FTTS-MSV. Easy access to frequent vehicle  
961 maintenance areas shall be inherent in the kit design. When parts of the  
962 protection kit must be removed for maintenance, they shall be easily and quickly  
963 removed and reinstalled so as not to increase the maintenance ratio beyond the  
964 requirement.

965 **Rationale.** Design of the kit with vehicle maintenance in mind will minimize  
966 the increased maintenance burden placed on the unit when in use.

967 **Crew Compartment Applique Protection Kit Storage.** The FTTS-MSV crew  
968 compartment protection kit shall be designed for storage for extended periods of  
969 time without adverse effects from weather (to include ice and blowing snow and  
970 sand), humidity, temperature, or sunlight in hot, basic, and cold climates as  
971 defined in AR 70-38.

972 **Rationale.** It is envisioned that this kit may be kept in long term outside  
973 storage in various parts of the world while awaiting use. The kit will not likely be  
974 installed in peacetime, except for brief training periods. Available storage space  
975 in some unit locations may be limited. Therefore, the kit may not always be  
976 stored under the most ideal conditions. It must be fully capable of maximum  
977 crew protection upon installation after extended periods of storage under adverse  
978 conditions.

979 **Small-Arms Protection.** Provide the crew compartment occupants protection  
980 from multiple hits from 7.62mm B32 Armor Piercing (AP) rounds or their  
981 equivalent. Protection shall be from rounds fired at 100 meters standoff range  
982 with no perforation when fired at 0-degrees obliquity horizontally over 0-360  
983 degrees attack directions to the vehicle and to the roof area at 60-degrees  
984 obliquity. The spacing between projectile impacts shall be set in accordance with  
985 appropriate military standards for the given material. Seat structure may be used  
986 to provide some of the 360-degree horizontal protection. Protection provided by  
987 the design of the seat shall not degrade soldier comfort or ease of operation.

988 **Area Weapon Protection.** Provide protection to the crew compartment occupants  
989 against artillery fragments (United States 155mm) with no perforation for each

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

990 detonation at a 60 meters (20 meters desired) standoff range for any degree  
991 elevation or azimuth to the vehicle. For vehicles with weapons mount, this  
992 requirement is with closed hatch.

993 **Rationale:** This protection will enhance soldier survivability against small  
994 arms ammunition and mortar/artillery fire anticipated in combat and peace  
995 keeping environments.

996 Any appliqué armor kit must be attached in 15 minutes and detached in 30  
997 minutes by the crew without any specialized Material Handling Equipment (MHE)  
998 or special tools.

999 **Rationale:** The FTTS-MSV requires a capability to have increased  
1000 survivability measures when the mission or threat dictates by add-on armor and  
1001 have the capability of rapidly shedding it when weight is a factor. The FTTS-  
1002 MSV is optimized for transportability and configured to increase survivability by  
1003 scalable means.

1004 The FTTS-MSV shall have a run-flat capability with tire tread that maximizes off-  
1005 road mobility while maintaining safe on-road handling and that can achieve tire  
1006 wear life of a minimum of 12,000 miles (Threshold) (18,000 miles -Objective) of  
1007 OMS/MP use. The run-flat capability shall permit safe driving after loss of air  
1008 pressure in any two tires (Threshold) (all tires - Objective) for at least 50 miles  
1009 (Threshold) (90 miles - Objective) without speed reduction over the OMS/MP  
1010 terrain.

1011 **Rationale:** Tire treads need to be designed primarily for off-road missions at  
1012 tactical standard mobility levels while at the same time they must be safe and  
1013 suitable for extended highway use as described in the OMS/MP. The run-flat  
1014 capability is needed to provide a get-away capability when under hostile  
1015 conditions and a limp home capability in the event of a flat tire while on a combat  
1016 mission. Tire life is important to maintain reasonable O&S costs and to keep  
1017 maintenance time devoted to tires to a minimum. The Objective parameters are  
1018 achievable goals that will reduce O&S costs due to tire wear by up to 50 percent.

1019 FTTS must provide combat identification (CID) of friend or unknown in a Joint,  
1020 Allied/Coalition environment through platform-to-platform (manned and  
1021 unmanned, ground and air), platform-to-soldier, soldier-to-platform and soldier-to-  
1022 soldier under all battlefield and weather conditions across the spectrum of  
1023 operations. CID systems must interface with the C4ISR communications network  
1024 for development and maintenance of the COP.

1025 **Rationale:** The ability of an FTTS CID system to positively identify friendly  
1026 platforms equipped with compatible/interoperable CID technologies is necessary  
1027 to prevent fratricide.

1028 **Camouflage.** The FTTS-MSV shall be painted in NATO three-color camouflage

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1029 or desert tan using Chemical Agent Resistant Coating (CARC) or a DA G4  
1030 approved substitute (Threshold).

1031 **Rationale.** Three-color is the standard Army equipment camouflage paint  
1032 scheme found to possess the ultimate hide capability in tactical operations. Use  
1033 of CARC or other approved substitute is needed to comply with the NBC  
1034 requirement in this document. Meeting the Objective will decrease detection thus  
1035 increasing the survivability of the system in a combat environment.

1036 **Interior Lighting.** Each FTTS-MSV must have an interior lighting capability that  
1037 automatically provides white light under closed-hatch conditions and blackout  
1038 light during open-hatch operations appropriate to the platforms' mission  
1039 (Threshold/Objective)

1040 **Rationale:** Degrades enemy detection by signature management and  
1041 stealth capabilities. A key signature during night operations is the emanation of  
1042 light.

#### 1043 **Sustainability**

##### 1044 **General**

1045 The FTTS MSV must organically sustain itself for three days of high tempo  
1046 operations without replenishment from external sources in continuous combat in  
1047 mid-to-high intensity conflict and be self-sustainable for up to seven days in low-  
1048 end conflict and peacetime military engagement. The UA must be self  
1049 sustainable for the specified time/OPTEMPO for Classes I, III, V, VIII, IX, and  
1050 water.

1051 **Rationale:** The Army will aggressively reduce its logistics footprint and  
1052 replenishment demand. This means that the OF will deploy fewer vehicles and  
1053 leverage combat service support reach capabilities that allow commanders to  
1054 uce stockpiles in theater while relying on technology to provide sustained  
1055 velocity management and real time tracking of supplies and equipment.

1056 Corrosion Resistance. Corrosion resistance shall be sufficient to ensure  
1057 serviceability for the entire expected 22 year EUL of the vehicle without rebuild.

1058 **Rationale:** The FTTS will operate and be stored in areas with high salt  
1059 content, and as such must be operable for extended periods in those  
1060 environments.

1061 The FTTS and its companion trailer will enable significant sustainment  
1062 effectiveness and efficiencies through commonality in platforms and components  
1063 to simplify and reduce logistics, support multi-functionality, reduce personnel and  
1064 skills required, and contribute to simplification of deployment. The emphasis will  
1065 be on the FTTS platform/module in addition to lateral commonality with FCS and 

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1066 will not concentrate on backward compatibility except as specifically addressed in  
1067 the ORD.

1068 **Rationale:** Commonality across formations, in platforms and components is  
1069 required to simplify and reduce sustainment requirements, support multi-  
1070 functional soldiers, reduce the many personnel and skills required in today's  
1071 organizations, and contribute to simplification of deployment, maintenance and  
1072 training, and to reduce equipment and other resource requirements.

1073

#### 1074 **Maintenance**

1075 Maintenance Ratio (MR) will not exceed 0.025 Maintenance Man-  
1076 Hours/Operating Hour (MMH/OH).

1077 **Rationale:** The Army will aggressively reduce its logistics footprint and  
1078 replenishment demand. The Objective Force will deploy fewer vehicles and  
1079 leverage reach capabilities. Also, the sustainment system will reduce  
1080 unnecessary nodes, both physical and decision-making. A "right-sized"  
1081  sustainment footprint will emerge. Maintenance operations within the OF will be  
1082 conducted using a vastly different approach from today's legacy structure.  
1083 Today's structure requires several echelons of maintenance supporting a  
1084 brigade. The FTTS must be supportable by a two level maintenance system  
1085 ("Field" and "Sustainment" maintenance). Field maintenance will consist of  
1086 repair-and-return-to-user on-system tasks, those tasks that do not require  
1087 disassembly of a component (primarily LRU/LRM replacement), and will be  
1088 performed forward in the battle space. Sustainment maintenance will consist of  
1089 repair-and-return-to-supply off-system tasks, those tasks required to return  
1090 components, subassemblies, and/or end item systems to a serviceable condition.  
1091 Sustainment maintenance will be performed by military, government civilians,  
1092 and/or contractors, and will take place at designated locations in the Unit of  
1093 Employment (UE) Units or potentially as far back as CONUS. The OF has been  
1094 designed with a significantly smaller footprint in maintenance personnel, and so  
1095 will require systems that are designed with significant increases in reliability and  
1096 allow maximum crew/operator repair and maintenance. Plug and play component  
1097 design of systems and subsystems, coupled with embedded diagnostic and  
1098 prognostic tools, will greatly enhance the capability of the crews to perform a  
1099 larger number of maintenance associated tasks. Heavy reliance on operator/crew  
1100 maintenance is essential to the OF concept of maintenance support and a key  
1101 factor in the overall reduction of the sustainment footprint. The operator of each  
1102 FTTS platform/module will be responsible for at least 60% of all field  
1103 maintenance requirements and limited battlefield damage assessment and repair  
1104 (BDAR). Each UA will have a small number of 2-3 man combat repair teams  
1105 (CRTs) within their organic Forward Support Battalion (FSB) to perform field

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1106 maintenance requirements beyond the capability of the operator, more in depth  
1107 BDAR, and limited recovery operations. The immediate maintenance support  
1108 focus within the UA will be those limited maintenance functions required to keep  
1109 systems operational until completion of the current operation pulse (72 hours to 7  
1110 days). FTTS platforms/modules deemed unsuitable for repair on site (METT-T  
1111 dependent) will be recovered to a safer location for those repairs necessary to  
1112 allow the platform to return to action and complete its current mission. Primary  
1113 method of recovery will be self or like vehicle recovery, augmented by the CRT or  
1114 UE (Equivalent) utilizing a FRMV/FTTS-MSV Wrecker as required. Systems  
1115 requiring extensive repair time, catastrophic failure, or extensive battle damage  
1116 will be evacuated to effect further repairs and may be replaced with "ready-to-  
1117 fight" replacements, if available. The FTTS will enable significant sustainment  
1118 effectiveness and efficiencies through commonality in platforms and components  
1119 to simplify and reduce sustainment, support multi-functionality, reduce personnel  
1120 and skills required, and contribute to simplification of deployment.

1121 Preventive Maintenance. FTTS platforms/modules must be designed so that  
1122 scheduled preventive maintenance services must not be conducted more  
1123 frequently than annually without adversely impacting the stated system reliability  
1124 requirements.

1125 **Rationale:** Reducing the required frequency of scheduled preventive  
1126 maintenance services will increase commander flexibility while deployed and  
1127 reduce the logistics footprint, time, and costs associated with maintenance at  
1128 home station.

1129 Oil and Lubricants. Single fluid shall be used for all lubrication and hydraulic  
1130 applications. All fluid analysis, if required, shall be performed on system with the  
1131 result provided to the interface of the maintenance system.

1132 **Rationale:** The need for a single fluid for lubrication and hydraulic  
1133 applications is dictated by the requirement to reduce numbers of types of fluid on  
1134 the battlefield. This consolidation of fluids will have a significant impact on the  
1135 logistics support requirements of the OF. An on-system analysis capability is  
1136 needed to ensure real-time information on the status of the lubricant system is  
1137 available to the UA maintenance system. This will reduce or prevent damage of  
1138 the vehicle as a result of lubricant contamination or degradation.

1139 If the FTTS-MSV incorporates a fuel burning engine, it shall operate on JP8 and  
1140 any standard Diesel fuels dispensed using standard Army refueling systems for  
1141 wheeled vehicles. Additionally, the FTTS-MSV shall be capable of operating on  
1142 fuels used by the FCS.

1143 **Rationale:** JP8 has been identified as the Department of Defense (DOD)  
1144 standard fuel. The use of any standard Diesel fuel as well as those fuels used by  
1145 the FCS will ensure the FTTS-MSV will have the capability to remain operational

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1146 in areas where fuel supplies are limited to what is available on hand.

1147 **Prognostics & Diagnostics.** The FTTS must incorporate an embedded  
1148 prognostic and embedded diagnostics system that identifies and displays fault  
1149 data to the individual component / LRU / LRM level. Both prognostics and  
1150 diagnostics must provide the level of detection and or isolation required to meet  
1151 the stated reliability and maintainability requirements. In order to provide  
1152 maximum coverage of critical failures, the embedded prognostics capability will  
1153 supplement, as appropriate for the critical components and their failure modes,  
1154 precursor-based prognostics with prognostics based on component life and  
1155 stress-histories. 

1156 Prognostics: All FTTS platforms/modules will incorporate an embedded  
1157 prognostics capability that will accurately predict pending critical system failures  
1158 (any failures that cause system aborts IAW the reliability definition) to the  
1159 appropriate LRU (LRU defined as any part or component replaceable by field  
1160 maintenance personnel) that might occur in a 72 hour mission, early enough to  
1161 allow corrective action before the unit begins the mission. Prognostics will  
1162 provide coverage for 45% SA and 35% EFF at a 90% accuracy rate (threshold)  
1163 70%SA and 65% EFF at a 99% accuracy rate (objective).

1164 **Rationale:** A reliable embedded prognostics and diagnostics system will  
1165 provide accurate and timely information to the crew and maintenance personnel.  
1166 This is a primary enabler for the crew chief to be able to do the majority of the on-  
1167 system maintenance tasks. Prognostics are a combat effectiveness enabler and  
1168 not a logistics enabler. The contribution of the prognostics system is dependent  
1169 upon the coverage, accuracy, and lead-time of the applied sensors. Prognostics  
1170 will provide increased system health awareness and enable increased combat  
1171 effectiveness by reducing the risk of unexpected critical failures during a mission  
1172 pulse. However, mis-prognosis does lead to unnecessary maintenance actions  
1173 and therefore, contributes to the requirement for a larger than necessary logistics  
1174 footprint. For that reason, reliable and accurate prognostics are critical.

1175 Diagnostics: All FTTS platforms/modules will incorporate an embedded  
1176 diagnostics capability that will identify the system failures accurately to the  
1177 appropriate LRU (LRU being defined as any card, module or component  
1178 replaceable by field maintenance personnel), with notification first to the crew,  
1179 then to the supporting maintenance personnel (through the logistics STAMIS)  
1180 The Diagnostic Sensor Suite will provide 95% coverage and < 3% error rate  
1181 (Threshold) 99% coverage and < 2% error rate (Objective).

1182 **Rationale:** Diagnostics is both a combat effectiveness and logistics enabler.  
1183 The value of diagnostics is a function of coverage and accuracy. Diagnostics will  
1184 reduce the time required of the crew chief and/or maintainers to identify and  
1185 isolate a fault, which will enable the proper maintenance action to occur more

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1186 quickly. Mis-diagnosis, like a mis-prognosis, will lead to an unnecessary  
1187 maintenance action and adversely impact logistics footprint. The FTTS  
1188 maintenance concept, with a heavy reliance on "replace forward" by the operator  
1189 or CRT, requires accurate and timely troubleshooting of system failures and  
1190 reduction in the removal and replacement of incorrect components. Prognostics  
1191 and diagnostics values will be developed based on future modeling of  
1192 technological maturity estimates.

1193 FTTS MSV must incorporate an embedded mission readiness system. This  
1194 system will monitor the status of mission-critical components/subsystems  
1195 (including the crew) and consumables. If a condition is detected that degrades  
1196 mission capability, the embedded system will determine what action (repair,  
1197 resupply, crew rest period, etc.) is required to restore full mission capability. The  
1198 embedded mission readiness system will interface with the crew operating  
1199 station and the C4ISR system to provide required status reports and alerts IAW  
1200 reporting criteria set by the operational commander. The embedded readiness  
1201 system will include the capability to forecast the future state of the FTTS system  
1202 on which it is located. It will forecast equipment degradation/failure using  
1203 prognostics algorithms and data from embedded sensors and operating  
1204 maintenance logs.

1205 **Rationale:** Permits sustainment of forces with supplies they need, when they  
1206 need them. Also facilitates cross leveling of supplies when required.  
1207 Commanders at all levels must be provided simply displayed but comprehensive  
1208 pictures of their sustainment status. This information must be tailorable to  
1209 display all or a portion of the COP as relevant to the various echelons and  
1210 functions. Threshold information may use current sustainment categories as  
1211 metrics, collating data passed up from platform level. This requirement is key to  
1212 the reduction of mechanics and the logistics footprint of the UA as well as  
1213 enabling the pulse logistics concept. Embedded diagnostics and prognostics on  
1214 platforms will reduce demand and minimize the maneuver sustainment burden  
1215 on unit effectiveness. Enables mission staging to rapidly execute sustainment  
1216 transitions with reduced logistics footprint.

1217 Interrogation Capabilities. The FTTS will have vehicle-to-vehicle diagnostics  
1218 interrogation capabilities enabling the operator and/or Combat Repair Team  
1219 (CRT) to diagnose vehicle failures without reliance on external TMDE.

1220 **Rationale:** By providing vehicle-to-vehicle back-up diagnostics capability,  
1221 portable TMDE within the UA can potentially be eliminated. This capability allows  
1222 vehicle diagnostics to be performed on non-operational vehicles.

1223 System Maintainability. Though it is expected that the FTTS will achieve high  
1224 levels of reliability, there will still be unscheduled failures and the need for  
1225 scheduled maintenance. Maintainability requirements ensure that the required

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1226 man-hours and clock-hours necessary to return the system to service are not  
1227 excessive, thereby allowing the system to be more readily mission capable.  
1228 FTTS platform designs should integrate pit stop-like efficiencies for repairing  
1229 failed systems with an ultimate goal of rapid return to combat capability. FTTS  
1230 platforms shall achieve the following minimum maintainability benchmarks:

- 1231 • Platform operator must be able to repair/replace at least 60% of SA, 60%  
1232 EFF, and 60% of NEFF unscheduled field maintenance requirements.
- 1233 • Mean time to repair (MTTR) must not exceed 0.5 hours.
- 1234 • Maximum time to repair (MaxTTR) for operator correctable faults must not  
1235 exceed 0.5 hours
- 1236 • Each FTTS platform/module shall contain the capability to perform  
1237 automated Preventive Maintenance Checks (PMC) Total time expended  
1238 on PMC will not exceed ten minutes to include non automated checks.

1239 **Rationale:** In order to meet combat power requirements for the FTTS, it is  
1240 imperative that systems are able to achieve assured mission reliability.

1241 FTTS-MSV systems shall be designed to allow crews to perform on-site repairs.  
1242 60% of all LRUs replaced by operator maintainer.

1243 **Rationale:** Within the envisioned force structure, a significant percentage of  
1244 repair actions will be performed at operator level. In order for the operator and  
1245 limited organic support assets to be able to sustain the force, FTTS-MSV  
1246 systems must be designed to minimize inherent repair time demands.

1247 The FTTS will require no more than 10 common tools on board and 10 additional  
1248 common tools on the FTTS-MSV Wrecker to perform all field level tasks. These  
1249 tools will be identical to the twenty tools used to perform all Field Level tasks on  
1250 the FSC FoS. There will be no special tools required for field level maintenance.

1251 **Rationale:** Reduces number of tools within the UA/UE, thus reducing the  
1252 logistics footprint

1253 Interactive Electronic Technical Manuals (IETM). Each FTTS Manned System  
1254 must have an on-board, full IETM capability that includes operator and  
1255 maintainer technical manuals (TMs) and Repair Parts and Special Tool Lists  
1256 (RPSTL) for all onboard equipment, including GFE items (Threshold/Objective).  
1257 The embedded virtual full task trainer will be fielded concurrently with the FTTS.  
1258 All technical manuals must be Class 5 or higher, Interactive Electronic Technical  
1259 Manuals, and include an embedded training to assist the mechanic/operator in  
1260 performing maintenance tasks and diagnosis.

1261 **Rationale:** DoD Directive 1430.13 states that the acquisition of a training  
1262 system that supports a new defense system or piece of equipment shall be

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1263 assigned the same priority as that of the parent defense system or equipment. It  
1264 further stipulates that the device should be available in time for the fielding of the  
1265 parent system. A 2 Oct 02 SAAL-RP memo, subject: Fielding Systems with  
1266 Complete Training and/or Unit Support Systems reiterates the importance of the  
1267 Army's complying with this policy.

1268 I.E.T.M Embedded Video Maintenance Support. The FTTS IETM software  
1269 platform will allow the operator/maintainer to view actual video coverage on all  
1270 Field Level Maintenance Tasks. The operator/maintainer will use the IETM for  
1271 standard maintenance fault isolation tasks, on-system video maintenance task  
1272 demonstration, and on-system video instructional or refresher training. The IETM  
1273 will have a multi option capability allowing the maintainer to access various tasks  
1274 and use links to access video instructions/demonstrations for the task. The video  
1275 function must allow start, stop, pause, rewind, fast forward, and return to the  
1276 maintenance window. This will allow the maintainer the option of viewing a  
1277 maintenance task on video and returning to the maintenance procedures to begin  
1278 the task. The video will be formatted using memory reduced compression, and  
1279 can be viewed through a high quality resolution screen.

1280 **Rationale:** This is the primary enabler for the operator/maintainer  
1281 requirement supporting OF force structure. A comprehensive replacement  
1282 instruction media will assist in timely Field Maintenance by providing the  
1283 operator/maintainer a capability to reference and view all Field Maintenance  
1284 replacement tasks using instructional video coverage.

#### 1285 **Power**

1286 Each FTTS-MSV shall provide an on-board power recharging capability for each  
1287 soldier's associated systems. (Threshold/Objective).

1288 **Rationale:** This capability is needed to support ancillary systems that perform  
1289 their function away from the vehicle and return for recharging. Improve both  
1290 strategic responsiveness and core warfighting abilities to the effectively fight as  
1291 an integral component of a joint, interdependent, full spectrum, mission-tailored  
1292 force by optimizing combat effectiveness via consumption reduction, alternative  
1293 generation, management, and distribution of power and energy across the force  
1294 for all systems: motive, electrical, and soldier.

1295 FTTS-MSV environmental control units (heating and air conditioning) shall  
1296 employ high efficiency systems utilizing power management.

1297 **Rationale:** Electronic systems within the FTTS-MSV will require an  
1298 operational environment conducive to efficient operation. Additionally, crew  
1299 comfort will allow for safer operation of the vehicle over long periods. Because  
1300 these systems are normally a power drain on the system, they must be efficient.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1301 The FTTS-MSV shall minimize the maintenance, hazardous waste costs, and  
1302 storage requirements associated with conventional electrical power storage  
1303 devices. (i.e. Batteries)

1304 **Rationale:** Reduces O&S costs and hazardous waste

1305 The power storage for the starting system shall be maintenance free.

1306 **Rationale:** Reduces O&S costs.

#### 1307 **Supply**

1308 The FTTS must automatically collect critical sustainment data and have the  
1309 capability to report sustainment data automatically through secure means, or  
1310 upon request

1311 **Rationale:** Commanders at all levels must be provided simply displayed but  
1312 comprehensive pictures of their sustainment status. This information must be  
1313 tailorable to display all or a portion of the COP as relevant to the various  
1314 echelons and functions. Information may use current sustainment categories  
1315 (operational availability by type platform, classes of supply, etc.) as metrics,  
1316 collating data passed up from platform level. Embedded diagnostics and  
1317 prognostics on soldiers and platforms will reduce demand and minimize the  
1318 maneuver sustainment burden on unit effectiveness. Enables mission staging to  
1319 rapidly execute sustainment transitions with reduced logistics footprint.

1320 FTTS-MSV shall have the capability to quickly cross level supplies i.e. fuel,  
1321 water, rations, ammunition, etc. between platforms (FTTS to FTTS and FTTS to  
1322 FCS) inside the UA.

1323 **Rationale:** Rapid cross leveling capability helps reduce the number of  
1324 resupply vehicles needed to sustain the force. This capability also improves  
1325 crew survivability by minimizing their exposure to enemy observation and fire  
1326 during resupply operations.

#### 1327 **Training**

1328 Any manned FTTS-MSV platform must be capable of acting in a training mode  
1329 using embedded virtual training.

1330 **Rationale:** Virtual, training allows soldier-operators that are not part of the  
1331 training audience to initialize exercises, control the supporting, opposing, neutral  
1332 and non-governmental agency semi-automated forces (SAF), and facilitate After  
1333 Action Review preparations.

1334 A Training Management System (i.e., Standard Army Training System or a  
1335 derivative) must be part of the embedded training system.

1336 **Rationale:** The training management function cannot be suspended during  
1337 UA deployments.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1338 FTTS-MSV training and training support systems must be backed up by a funded  
1339 Life Cycle Training Support System that can respond quickly to mission and  
1340 system related changes. System will have open architecture, and be  
1341 reprogrammable.

1342 **Rationale:** Embedded training systems cannot be physically separated from  
1343 its platform and therefore must be sustained as part of the FTTS-MSV Life Cycle  
1344 Support System.

1345 Training software products will be compliant with appropriate standards, such as  
1346 the Joint Tactical Architecture - Army (JTA-A), the Army Training Information  
1347 Architecture (ATIA), the Common Training Instrumentation Architecture, and the  
1348 High Level Architecture (HLA).

1349 **Rationale:** These common standards enable the development of reusable  
1350 training software application product-lines that will facilitate dynamic updates,  
1351 minimize software maintenance costs, facilitate interoperability, and conserve  
1352 Army resources.

1353 FTTS-MSV platforms shall have an embedded enroute mission planning and  
1354 rehearsal system (EMPRS) with the following capabilities - provide world-wide  
1355 communications and hardware/software applications sufficient to support  
1356 collaborative planning functions such as chat, file transfer, white boarding, and  
1357 teleconferencing between enroots, in-theater and in-CONUS commanders -  
1358 support development of a Training Support Package (TSP) for virtual distributed  
1359 collective training - produce simulation initialization files, produce a set of After  
1360 Action Review aides reflecting scenario planning factors (e.g., task organization,  
1361 mission, concept of operation, operational graphics) - be capable of preparing  
1362 and displaying non-traditional operational graphics representing the UofA  
1363 Patterns of Operations.

1364 **Rationale:** Embedded training requires semi-automated forces, to surround  
1365 the training audience with adjacent, supporting, opposing and neutral forces that,  
1366 collectively form the combined arms training environment.

1367 C4ISR dynamic addressing capability must operate uninterrupted in the training  
1368 and mission rehearsal modes while simultaneously supporting ongoing military  
1369 operations.

1370 **Rationale:** Training exercises will normally involve one or more units within  
1371 the Unit of Action. Training exercises and real operational missions will require a  
1372 separate address lists.

1373 All operator and maintainer training documents must be delivered in a standard  
1374 format that must include identification of the structure or subcomponents of the  
1375 technical manual to facilitate sharing of the material between functional groups.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1376 Must be integrated into the training IETM and on-board database with backup  
1377 available in a separate format.

1378 **Rationale:** UA soldiers must be multi-faceted, adaptive and self aware-  
1379 knowing how to perform more tasks and because sustainment in the first 72  
1380 hours of a deployment on a non-linear battlefield will be limited, they must be  
1381 able to maintain their systems, often with knowledge obtained from knowledge  
1382 repositories over the C4ISR system.

#### 1383 Embedded Training

1384 Embedded Training will be inherent in FTTS-MSV design and should take on two  
1385 roles. It can serve as a delivery mechanism for Interactive Multimedia (IMI) and  
1386 other computer based training. It will also serve as a means to embed the IETM  
1387 (Interactive Electronic Technical Manual ).

1388 **Rationale:** The communications capabilities in the FTTS-MS will support  
1389 downloads of training content that can be delivered to the soldier in the vehicle.  
1390 Embedded training devices should complement the user interfaces existing in the  
1391 vehicle, but should not duplicate controls found inside the vehicle.

#### 1392 **Interoperability** TBD

#### 1393 **Information Exchange Requirements (IER).**

1394 The FTTS-MSV must communicate and transfer data through an organic  
1395 electronic vehicle/asset tracking system compatible with C4I systems used by the  
1396 FCS. Vehicle logistic tracking system shall be in accordance with the Information  
1397 Dissemination Management (IDM) and/or the Global Information Grid (GIG)  
1398 Capstone Requirements Documents (CRDs) as applicable.

1399

1400 **Rationale:** The FTTS will be part of the CROP. In order for the operator to  
1401 send/receive data, the FTTS must have the same compatability to view the  
1402 CROP as the combat units.

1403 The FTTS-MSV shall comply with the most current version of the Joint Technical  
1404 Architecture (JTA).

1405 **Rationale:** TBD

#### 1406 **Logistics and Readiness**

1407 Logistics.

1408 The FTTS-MSV must be supported by the Army two level maintenance system  
1409 and standard Army log systems. The FTTS-MSV shall be supported logistically  
1410 by both military and contract personnel using the most cost effective means  
1411 available during peacetime with acceptable risk when transitioning to wartime.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1412 The FTTS-MSV shall have built in test/built in test equipment (BIT/BITE) (to  
1413 encompass TMDE) and embedded diagnostics and prognostics with Interactive  
1414 Electronic Technical Manual (ITEM) capability.

1415 **Rationale:** The FTTS-MSV will operate in austere environments. Operators  
1416 must have the capability to perform PMC, diagnosis, and repair mission essential  
1417 equipment.

1418 The system shall withstand corrosion when aboard pre-positioned afloat vessels  
1419 deployed using ships or stationed in high salt air environment. When stored,  
1420 the FTTS-MSV shall be maintained so that it is readily available for deployment.

1421 **Rationale:** The FTTS-MSV may be pre-positioned to meet ASMP time  
1422 requirements. The FTTS-MSV must be maintained in a sufficiently robust manner  
1423 so as to avoid operational delays.

1424 Reliability, Availability, and Maintainability Objectives. The FTTS-MSV must  
1425 have a level of reliability that will ensure that the system will not fail under  
1426 mission profiles.

1427 **Rationale:** TBD

1428 Reliability To achieve high levels of system readiness and pulsed reliability,  
1429 FTTS platforms must surpass legacy combat system reliability. Reliability  
1430 requirements are established to provide measurable system benchmarks that  
1431 establish equipment design parameters and drive platform  
1432 subsystem/component reliabilities. FTTS platforms must achieve the following  
1433 system (Total mission package, including GFE) reliability benchmarks.

1434 Mean Time Between System Abort (MTBSA): (failures that deadline a platform,  
1435 result in unsafe operation, or make it non-mission capable): MTBSA for a 72  
1436 hour, high OPTEMPO mission pulse must be greater than or equal to 2800 hours

1437 Mean Time between Essential Function Failure (MTBEFF) is failure that results  
1438 in system degradation. The MTBEFF for a 72 hour, high OPTEMPO mission  
1439 pulse must be greater than or equal to 675 hours (Current complex systems have  
1440 demonstrated a ratio of 4 EFFs for each SA.)

1441 Mean Time Between System Abort –Mobility (MTBSA-M) failures are those that  
1442 affect a platform's mobility system, resulting in unsafe operation, or making it  
1443 non-combat capable. MTBSA-M for a 72 hour, high OPTEMPO mission pulse  
1444 must be greater than or equal to 6450 hours.

1445 **ESOH and Other System Characteristics**

**DRAFT**

Future Tactical Truck System – Maneuver Sustainment Vehicle

FTTS-MSV

Emerging Desired Capabilities

1446 Annex A

1447 Cargo Variant.

1448 An FTTS-MSV cargo variant shall be capable of operating in garrison and field  
1449 environments and safely self-loading, securing, transporting, and self-unloading  
1450 the following cargos at the following payloads:

	Unimproved Roads	
<u>Cargo</u>	<u>Threshold</u>	<u>Objective</u>
Standardized Containers Up To 20 Feet <sup>a</sup>	11 Tons	11 Tons
Family Of Flatracks <sup>b</sup>	11 Tons	11 Tons
Break Bulk Cargo <sup>b</sup>	11 Tons	11 Tons

1451 <sup>a</sup> Any combination of standardized containers up to a twenty (20)  
1452 foot Equivalent Unit (TEU) (ISO, PALCONS, SIXCONS, QUADCONS, MCESS  
1453 and ASLMS)(Payload does include the weight of the container)

1454 <sup>b</sup> Payload does not include the weight of the flatrack and  
1455 assumes 16.5 tons is maximum load permitted by the flatrack.

1456 **Rationale:** TBD

1457 **Speed:** The FTTS-MSV cargo variant at improved surface GCW shall be  
1458 capable of sustaining speeds for over the road movement on public highways at  
1459 posted speeds.

1460 **Rationale:** TBD

1461 **Storage.**

1462 The tool storage capacity shall be sufficient to provide secure storage for all  
1463 required collateral and on-vehicle equipment as well as tool kits.

1464 **Rationale:** The ability to carry tools and critical repair parts on-board is  
1465 essential to quickly repairing platforms to ensure high mission readiness.

1466 Access to storage from the exterior will be unhindered

1467 **Rationale:** Tools and accessories must be readily available for crew usage  
1468 as needed.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1469 **Cargo Tie-Down Provisions.** The FTTS-MSV shall have cargo tie-down  
1470 provisions in the cargo area that meet military standard requirements and shall  
1471 be certified to transport ammunition.

1472 **Rationale.** For safety of personnel and cargo inside the vehicle, equipment  
1473 must be capable of being secured (tied down or strapped) to prevent movement  
1474 or shifting during vehicle operation.

1475 Load Towing Characteristics.

1476 Towing Capacity. At GCW, the FTTS-MSV shall be capable of pintle towing a  
1477 trailer with a payload up to \_TBD\_ tons (threshold) on unimproved roads,  
1478 \_TBD\_ tons (objective) on improved roads. The FTTS (Truck and trailer) must  
1479 be compatible with as a minimum the HEMMT-LHS and the PLS trailer.

1480 **Rationale:** The ability to pull / tow trailers other than the FTTS trailer greatly  
1481 enhances the FTTS' overall capability. In addition, by making the FTTS trailer  
1482 compatible with the HEMTT LHS and PLS enhances the movement of cargo and  
1483 equipment. The goal of seamless distribution across the battlefield requires  
1484 compatibility with current systems.

1485 Companion Trailer Towing. The FTTS-MSV shall be capable of safely towing,  
1486 over the FTTS-MSV OMS/MP, the FTTS-MSV companion trailer described  
1487 below.

1488 **Rationale:** The FTTS-MSV needs to be able to safely tow the companion  
1489 trailer to ensure all UA systems using an FTTS-MSV trailer as an Associated  
1490 Support Item of Equipment (ASIOE) can be relocated on the future battlefield.

1491 Backward Compatibility. The FTTS-MSV shall be able to safely tow, over the  
1492 FTTS-MSV OMS/MP, all systems currently towed by the HEMTT Family.  
1493 Achieved speeds of the FTTS-MSV and towed system combination shall be  
1494 equal to or greater than those achieved by the HEMTT and the same towed  
1495 system.

1496 The FTTS-MSV must be backward compatible with the existing vehicle towed  
1497 loads to ensure all mission-required equipment will be adequately supported on  
1498 the future battlefield

1499 Towed Load Brake Control. The FTTS-MSV shall have the capability for positive  
1500 control of towed system brakes.

1501 **Rationale:** Future military trailers/towed weapons systems may have positive  
1502 braking systems that operate in both directions. This requirement will ensure  
1503 future compatibility.

1504 Towed Load Power and Control. When applicable, the FTTS-MSV shall be  
1505 capable of providing power and active control of the towed load.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1506 **Rationale:** Future military trailers/towed weapons systems may have integral  
1507 motors that provide enhanced off-road mobility. This requirement will ensure  
1508 compatibility with this type system.

1509 The FTTS-MSV shall be capable of self loading, off-loading, and configuring LHS  
1510 payloads within 5 minutes. Self Loading/Off loading time begins from the time  
1511 the lift arm is engaged to the time the LHS payload is at its intended destination  
1512 point (i.e. on the truck and/or trailer, on the ground, in/out of a container onto the  
1513 truck and/or trailer, in/out of an aircraft onto the truck and/or trailer, etc...)

1514 **Rationale:** LHS operations doctrinally increase efficiency in the distribution  
1515 pipeline and currently take 5 minutes or less to load/unload LHS payloads. This  
1516 efficiency must be retained to ensure effectiveness of on time on target delivery  
1517 to Objective Force units. .

1518 The FTTS-MSV and its companion trailer shall directly load/off load cargo laden  
1519 or empty Modular Platform Systems (MPS)/pallets to/from aircraft and to/from the  
1520 TSV without additional interfaces and/or materials handling equipment (including  
1521 other services' equipment).

1522 **Rationale:** Material handling equipment increases the logistic footprint  
1523 and increases the transportation assets required to move the force.

1524 The FTTS\_MS V shall move containers up to the allowable handling capacity of  
1525 the lift system within the TSV cargo hold.

1526  **Rationale:** Containers may need to be repositioned in transit.

#### 1527 **Versatility**

1528 FTTS-MSV shall receive, re-configure, and distribute Mission and Unit  
1529 Configured Loads (MCL/UCL).

1530 **Rationale:** Reduces sustainment footprint and speeds re-supply

1531 FTTS-MSV shall rearm fighting platforms through a common hatch configuration.

1532 **Rationale:** Enable mechanical handling of resupply reducing manual handling  
1533 of ammunition.

1534 FTTS-MSV and its companion trailer shall receive and retrograde empty flatracks  
1535 and configured loads of excess supplies and repairable parts.

1536 **Rationale:** The FTTS-MSV and its companion trailer will be used as part of  
1537 the reverse distribution pipeline to retrograde excess supplies and repairable  
1538 parts. Excess supplies will then be returned to the supply system. Parts will be  
1539 directed to a maintenance facility for repairs, then returned to inventory or  
1540 evacuated back to CONUS

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1541 FTTS-MSV shall have the capability to employ Automated Identification  
1542 Technology (AIT) to provide strategic, operational, and tactical logistics systems  
1543 with the vehicle data needed to enhance the Army's ability to request, receive,  
1544 redirect, track, distribute, control and retrograde within the integrated distribution  
1545 system.

1546 **Rationale:** AIT is an enable that permits cross-leveling of supplies thereby  
1547 reducing materiel sustainment, equipment, personnel, facilities, and services  
1548 requirements.

1549 The FTTS Fuel Tank Module must be capable of open port refueling and be  
1550 compatible with the FCS refueling system, incorporating a locking fast-refueling  
1551 capability and the capability to draw fuel from a fuel cell. FTTS must be  
1552 interoperable with legacy and interim systems.

1553 **Rationale:** The time required to refuel systems must be kept to an absolute  
1554 minimum. This capability allows for complete refueling of a vehicle with multiple  
1555 fuel tanks from a single port. Open-port refueling is required when pressure  
1556 system is not available or when fuel is transferred from one system to another.

1557 Enable FTTS-MSV operators to meet a productivity cycle standard for self-  
1558 loading/unloading, transferring and securing one (1) modular platform, CROP,  
1559 PLS flatrack or 40 inch by 48 inch pallets mounted on a trailer, semi trailer, or  
1560 modular platform. [T] Average standard cycle time is 3 minutes [T] per modular  
1561 platform, CROP, PLS flatrack or one pallet [O] is 2 minutes per modular platform,  
1562 CROP, PLS flatrack or pallet These operations will be performed meeting the  
1563 following criteria:

- 1564 a. Establish the proper center of gravity for movement.
- 1565 b. Unload selected module, modular platform or pallet.
- 1566 c. Reconfigure the remaining load to maintain the proper center of gravity.
- 1567 d. Secure load for movement.

1568 **Rationale:** The UA operational concept calls for rapid resupply and the  
1569 tactical relocation of maneuver forces throughout the battle space. US Army  
1570 Transportation School has established three (3) minutes as the work standard for  
1571 handling pallets and containers on all terrain surfaces. This standard is  
1572 mission performance based on: TOE Section I mission workloads; for aircraft  
1573 load/unload times and meeting unit time-phased force and deployment list  
1574 (TPFDL) departure/arrival times;

1575 The Intelligent Load Handling System (ILHS) must operate as a dual function of  
1576 the modular platform self load arm. ILHS shall have the agility and range of  
1577 motion to pick up and transport pallets that are stacked unevenly on unimproved  
1578 terrain or positioned in or on itself and various modes of transport. The ILHS will

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1579 load modular containers and platforms on the FTTS as well as configure modular  
1580 packaged loads on platforms.

1581 **Rationale:** Leverage pre-configuration packaging and platform-  
1582 embedded material handling and lift for rapid, accurate and agile resupply that  
1583 minimizes demand on soldiers. This contributes to eliminating material handling  
1584 equipment in the battlespace and facilitates conduct of Sustainment  
1585 Replenishment operations.

1586 Lift Arm. The vehicle-installed robotic lift arm must be capable of  
1587 loading/unloading a 13 ton load under the following conditions:

1588 From/down to payload base one foot below ground level.

1589 **Rationale:** System will be used in a field environment and may be required to  
1590 load or unload system in rough terrain.

1591 From/onto uneven ground slope of five degree (threshold), with ten degrees  
1592 (objective), from the prime mover's lateral and horizontal axes.

1593 **Rationale:** System will be used in a field environment and may be required to  
1594 load or unload system in rough terrain.

1595 Overload. A safety allowance that meets industry standards for overload will be  
1596 incorporated into the FTTS-MSV hydraulic lifting system.

1597 **Rationale:** Safety requirement

1598 Approach Angle. The FTTS-MSV ILHS system shall be able to attach to a  
1599 payload from an approach angle of 10 degrees (threshold), 20 degrees  
1600 (objective), from the vehicle center line and load and secure the payload to the  
1601 prime mover. Threshold: 10 degrees Objective: 20 degrees

1602 **Rationale:** System will be used in a field environment and may be required to  
1603 load or unload system in rough terrain

1604 Securing Load.. International Standards Organization (ISO) Locks. Cargo  
1605 variants shall accommodate ISO locking device-equipped cargo containers

1606 **Rationale:** . To properly secure the load.

1607 **Modular Platform System.** The modular platform shall be the primary  
1608 distribution platform. It shall split into sections that can be loaded and distributed  
1609 individually. System will facilitate connection of the sections without the use of  
1610 additional MHE to form a single "CROP-like" platform. As such it will retain the  
1611 capabilities and characteristics of that intermodal platform. In addition the  
1612 Modular Platform shall load directly onto any aircraft, be sufficiently secured with  
1613 restraint rails on 463L equipped aircraft for air transport, and be capable of  
1614 incorporating Automated Identification Technology devices to track the platform  
1615 and its contents. In both the split mode and as an entire platform, the Modular

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1616 Platform shall be capable of being sling loaded or airdropped without damage to  
1617 the platform or its payload.

1618 **Rationale:** The modular design allows delivery of loads commensurate with  
1619 demands. The platform must be interoperable with commercial and military  
1620 modes of transfer and transport to include NATO standards. DoD standards  
1621 require lock-in for aircraft rails and tiedowns for safe transport without time-  
1622 consuming preparations. AIT provides asset tracking of the payload and  
1623 recovery/management of the platforms. The UA O&O Plan and Concept for  
1624 Maneuver Sustainment Operations states an increased reliance on aerial  
1625 delivery to match the expected operational tempo.

1626 FTTS-MSV modular platforms shall have the following characteristics:

1627 Payload weight capacity. The modular platform and secured payload shall have a  
1628 maximum gross weight of 13 tons. The platform shall be capable of carrying 11  
1629 tons (Threshold), 12 tons (Objective).

1630 **Rationale:** The maximum gross weight of 13 tons meets the 16.5 ton  
1631 payload restriction agreed upon between the U.S., UK, and GE Armies for  
1632 demountable cargo beds. Additionally, it allows the HEMTT-LHS to carry the  
1633 platform. The 11 ton payload is required for current ammunition configured  
1634 loads.

1635 Container Compatibility. When empty and/or fully loaded, shall be capable of  
1636 being inserted into, transported, and extracted from ISO 8x8x20-foot end opening  
1637 containers (Threshold), two empty and/or fully loaded modular platforms per  
1638 8x8x40-foot ISO single-end-opening container (Objective).

1639 **Rationale:** Objective Force distribution concepts call for a seamless  
1640 intermodal distribution system from factory to foxhole. ISO containers will  
1641 continue to be used for strategic distribution, while modular platforms will be used  
1642 for tactical distribution. The ability to place a fully loaded modular platform inside  
1643 an 8x8x20-foot ISO container is needed eliminate the seam between these two  
1644 systems and to facilitate configured load delivery to unit level. The Objective of  
1645 transporting two loaded modular platforms in an 8x8x40-foot ISO container  
1646 increases flexibility of shipping lightweight cargo other than ammunition while  
1647 maximizing available transport capability. Additionally, the use of 40-foot  
1648 containers reduces the ship loading and unloading times, thus increasing supply  
1649 velocity.

1650 Container/Modular platform Interface. During insertion, transport, and extraction  
1651 of the modular platform, no damage shall occur to the ISO container to the point  
1652 where the container no longer meets ISO 1496-1 standards. Means shall be  
1653 provided which eases the insertion/extraction of the modular platform into/from  
1654 the container and prevents damage to the container or modular platform.

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

1655       **Rationale:** Needed to prevent damage to the container and modular platform  
1656 and to preclude the requirement for repainting the edges of the modular platform  
1657 after each use.

1658       Container Stuffing/Unstuffing. When fully loaded, shall be capable of being  
1659 extracted from and inserted into an ISO container using the FTTS-MSV, a forklift  
1660 truck of appropriate capacity, other MHE, HEMMT-LHS, or a PLS truck.

1661       **Rationale:** Configured loads will arrive on modular platforms in containers.  
1662 To maximize speed and efficiency of throughput, FTTS-MSV, HEMMT-LHS, or  
1663 PLS trucks will extract platforms directly from containers to transport them to  
1664 users or SSAs. In some locations at the UE level, forklift trucks or other MHE  
1665 may be needed for inserting/extracting modular platforms into/from containers.

1666       Payload Types. The modular platform shall be capable of transporting all Army  
1667 equipment and supplies (within the payload, bed dimensions, and center of  
1668 gravity limitations) which, when loaded on the FTTS-MSV, does not cause an  
1669 unsafe condition to the vehicle.

1670       **Rationale:** The modular platform is the cargo bed of the FTTS-MSV; as  
1671 such, it must be able to safely transport any load reasonably expected of the  
1672 vehicle.

1673       Container Restraint System. A fully loaded modular platform shall be capable  
1674 of being positioned, secured, and transported within an 8x20-foot ISO container  
1675 throughout commercial and military distribution networks to include ammunition  
1676 transportability and rail hump testing. An automatic or manual locking  
1677 mechanism is required such that when the modular platform is inserted into the  
1678 container, the locking devices shall automatically position or can be manually  
1679 positioned to complete securing the modular platform in the container. If a  
1680 manual system is used, it shall require no more than 5 minutes for one soldier to  
1681 secure the modular platform for shipment or release the modular platform for  
1682 removal from the container. No uncaptured tools shall be required for this  
1683 operation. The restraint system shall restrain the modular platform to a  
1684 maximum of ½-inch movement laterally, longitudinally, and vertically.

1685       **Rationale:** A self-contained restraint system to secure the modular platform  
1686 in the container is needed to provide one of the modular platform advantages,  
1687 which is to eliminate the need for separate dunnage to secure a load of cargo in  
1688 an ISO container during transport throughout the container transport network,  
1689 thus reducing cargo stowage and discharge time and manpower.

1690       Stackable Empty. Modular platforms shall be stackable with A-Frame end(s)  
1691 folded down. Each modular platform shall have integral locking devices to permit  
1692 stacking six high (Threshold), stacking to a total of 26,000 pounds total weight or  
1693 dimensional limits of an 8x8x20-foot ISO container, which ever comes first (O).

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1694 Stacked empty modular platforms shall be capable of being inserted by  
1695 appropriate forklift truck, MHE, PLS, HEMTT-LHS or FTTS-MSV as a unit into an  
1696 ISO container and secured for intermodal shipment.

1697 **Rationale:** This feature is needed to optimize shipping and storage space for  
1698 empty modular platforms. Transporting stacks of six empty modular platforms  
1699 coupled with the capability to insert stacks into containers provides the ability to  
1700 rapidly and safely move empty modular platforms anywhere in the strategic or  
1701 tactical distribution systems. Six modular platforms should be within the payload  
1702 capacity of the FTTS-MSV.

1703 Smart Tiedown System. The modular platform shall have a load-conforming  
1704 cargo restraint system so that any load shall be capable of being secured IAW all  
1705 requirements for air, rail, sea, or highway movement. The system shall allow two  
1706 (Threshold), one (Objective) operator(s) to secure the load. The system shall  
1707 enable the load for a complete modular platform at its gross weight and cube to  
1708 be secured within 15 minutes (Threshold), 8 minutes (Objective).

1709 **Rationale:** The Smart Tiedown System is required to secure loads for  
1710 intermodal shipment and to reduce the time and materials necessary to secure  
1711 loads. The manpower requirement is needed due to the FTTS-MSV crew size.  
1712 The time requirement is necessary to meet UA concept timeframes for CRO and  
1713 SRO.

1714 Lift Provisions.

1715 Multipurpose Provisions. The modular platform shall be equipped with  
1716 multipurpose provisions that meet the requirements of MIL-STD-209 at maximum  
1717 gross weight.

1718 **Rationale:** To ensure that the modular platform can be lifted by conventional  
1719 cranes at depots, ports, and other locations when PLS and forklift trucks are not  
1720 available, and to ensure that the modular platform can be adequately restrained  
1721 (to aircraft, flatcars, etc.) when transported outside of a container.

1722 Helicopter Lift. The modular platform, when loaded to 25,000-pound gross  
1723 modular platform weight and configured for external helicopter transport, shall be  
1724 able to be lifted as a CH-47D helicopter two-point sling load.

1725 **Rationale:** Objective Force operations dictate that modular platforms may be  
1726 delivered or retrieved by helicopter. The 25,000-pound gross modular platform  
1727 weight is the maximum capacity CH-47D cargo hooks.

1728 Deck End Strength. The non-A-Frame end shall permit occasional loading and  
1729 unloading of wheeled and tracked vehicles up to the payload of the modular  
1730 platform, during field operations.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

- 1731       **Rationale:** One of the missions of the PLS is to provide for retrograde  
1732 movement of supplies and equipment. Loading such equipment in the field  
1733 without special MHE must be done over the end of the modular platform.
- 1734 Corrosion Control. The modular platform shall withstand climatic elements to  
1735 include salt spray for at least ten years (Threshold), twenty years (Objective),  
1736 without harmful effect and be treated to resist corrosion, rust, and rot (if wood is  
1737 used in the construction). Contact between dissimilar metals shall be avoided.
- 1738       **Rationale:** This feature is needed to ensure that the modular platform will  
1739 withstand the effects of the combat environment as well as the effects of long  
1740 term, open storage. The Objective of twenty years equates to the twenty year life  
1741 of the PLS.
- 1742 Forklift Provisions.
- 1743 Side. The modular platform and its individual sections shall have provisions to  
1744 permit lifting, when empty or fully loaded, from either side by a forklift truck of  
1745 appropriate size.
- 1746       **Rationale:** This capability is needed in the event the modular platforms are  
1747 moved, relocated, or loaded onto non-PLS vehicles by forklift truck.
- 1748 A-Frame End. The entire modular platform A-Frame end shall be designated for  
1749 “wheelbarrow” lift either loaded or empty by appropriate sizes of forklift trucks.
- 1750       **Rationale:** This feature is required to ensure the A-Frame end of the  
1751 modular platform will accommodate the 6K and larger forklift trucks without  
1752 damage or deformation when needed to stuff/unstuff either loaded or empty  
1753 modular platforms into/out of ISO containers.
- 1754 Air Transport. The modular platform shall be transportable, both empty and with  
1755 13-ton maximum gross weight, in C5, C17, and C130 aircraft. The modular  
1756 platform shall be capable of direct loading using the aircraft floor rollers without  
1757 463L pallets. The modular platform shall be capable of being secured by the  
1758 restraint rails on 463L equipped aircraft.
- 1759       **Rationale:** To ensure that the modular platform with normal payload is air  
1760 transportable.
- 1761 A vehicle alignment system must enable the FTTS operator to safely and  
1762 effectively align with modular platforms, containers, Air Force aircraft, trailers, or  
1763 other trucks for loading, unloading, or trans-loading (Time TBD)
- 1764       **Rationale:** A vehicle alignment system enables the FTTS to quickly align  
1765 (eliminating necessity for a ground guide ) with modular platforms, containers,  
1766 Air Force aircraft, trailers, or other trucks for loading, unloading, or trans-loading.  
1767 Source of requirement is TRADOC Pamphlet 525-4-0, para 4-4.3 b (1), dated 20

**DRAFT**

Future Tactical Truck System – Maneuver Sustainment Vehicle

FTTS-MSV

Emerging Desired Capabilities

1768 Sep 02 Subject: UA Army Concept for Maneuver Sustainment Operations in  
1769 Support of the Objective Force

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

1770 ANNEX B Wrecker

1771 FTTS-MRV (Maintenance Recovery Variant) will possess the following  
1772 characteristics in addition to the basic vehicle requirements

1773 An FTTS-MSV wrecker variant shall be capable of towing the heaviest FTTS  
1774 platform /module with its full payload and sustaining the following:

Road Surface	Grade (%)	RMS Roughness (inches)	Speed (MPH) (Threshold)	Speed (MPH) (Objective)
Paved	0	0.1	45	55
Paved	2	0.1	25	35
Paved	3	0.1	20	NA
Gravel	0	0.7	25	NA
Unimproved	0	1.5	10	NA
Unimproved	0	2	5	NA

1775 **Rationale:** TBD

1776 The wrecker variant shall be able to lift and tow and flat tow all UA systems and  
1777 current TWV at GCW front or rear without damage to either the towed or towing  
1778 vehicles through the full range of the towing vehicle's performance characteristics  
1779 without restriction,

1780 **Rationale:** Must have the ability to tow vehicles without damage to either  
1781 platform.

1782 Wrecker variant shall provide the ability to umbilical the brake system on its  
1783 towed load.

1784 **Rationale:** Provide for assisted braking.

1785 The wrecker shall be designed to perform its functions with a crew of two

1786 **Rationale:** Conservation of assets TBD

1787 Tool storage capacity shall be sufficient to provide secure storage for all required  
1788 collateral and on-vehicle equipment (OVE) as well as general mechanics tool kits  
1789 and BDAR kits. All stowage shall be rainproof and equipped with drain holes.

1790 Equipment subject to damage from water that would make it inoperable shall be  
1791 stored in rainproof stowage above the fording line to avoid requiring

# DRAFT

## Future Tactical Truck System – Maneuver Sustainment Vehicle

### FTTS-MSV

#### Emerging Desired Capabilities

1792 waterproofing storage compartments. Access to storage will be unhindered. Tool  
1793 storage areas shall be designed to prohibit damage to all contents.

1794 **Rationale:** Secure and efficient stowage for tools and associated equipment.

1795 A capability to employ power tools to speed recovery / repair operations shall be  
1796 incorporated in the wrecker variant.

1797 **Rationale:** Provides capability to rapidly conduct field repairs.

1798 The wrecker shall incorporate the capability to cut both ferrous and non-ferrous  
1799 metals.

1800 **Rationale:** Hercules Requirement.....TBD

1801 The winch or winches shall be of sufficient capacity to perform up to a double line  
1802 recovery of 150% of the HGWW of the recovered vehicle.

1803 **Rationale:** Recovery of the heaviest FTTS variant with its full payload.

1804 The wrecker variant shall incorporate the ability to remove, traverse, and place  
1805 the heaviest powerpack from all platforms within the UA

1806 **Rationale:** Provides capability to rapidly conduct field repairs .

1807 The wrecker must possess a capability to power the hydraulic lift system on the  
1808 FTTS-MSV cargo variant.

1809 **Rationale:** Capability needed to off-load cargo in the event of failure of the  
1810 cargo variant's power.

1811 Interactive Electronic Technical Manuals (IETM). Each FTTS MRV must have an  
1812 on-board, full IETM for all systems in the UA/UE that includes operator and  
1813 maintainer technical manuals (TMs) and Repair Parts and Special Tool Lists  
1814 (RPSTL) for all onboard equipment, including GFE items (Threshold/Objective).  
1815 The embedded virtual full task trainer will be fielded concurrently with the FTTS.  
1816 All technical manuals must be Class 5 or higher, Interactive Electronic Technical  
1817 Manuals, and include an embedded training to assist the mechanic/operator in  
1818 performing maintenance tasks and diagnosis.

1819 **Rationale:** DoD Directive 1430.13 states that the acquisition of a training  
1820 system that supports a new defense system or piece of equipment shall be  
1821 assigned the same priority as that of the parent defense system or equipment. It  
1822 further stipulates that the device should be available in time for the fielding of the  
1823 parent system. A 2 Oct 02 SAAL-RP memo, subject: Fielding Systems with  
1824 Complete Training and/or Unit Support Systems reiterates the importance of the  
1825 Army's complying with this policy.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1826 ANNEX C 5<sup>th</sup> Wheel

1827 Fifth Wheel Variant. The MSV (tractor) version shall tow a M870, SLOT, M871,  
1828 M872 or commercial semi-trailer with up to 40 ST payload.

1829 Rationale: TBD

1830 The FTTS-MSV fifth-wheel variant towing the M870 series trailer at maximum  
1831 payload on a paved road shall be capable of sustaining speeds for over the road  
1832 movement on public highways at posted speeds.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1833 ANNEX D Companion Trailer

1834 FTTS-MSV Companion Trailer shall have the following characteristics:

1835 Control. The FTTS-MSV companion trailer should be independently controlled  
1836 by no more than one operator from within the truck's cab for self deployment  
1837 missions.

1838 **Rationale:** The FTTS-MSV trailer may be self deployed to deliver  
1839 cargo/supplies to combat units to promote expediency in resupply operations.

1840 Tracking. The FTTS-MSV companion trailer shall be designed to ensure proper  
1841 tracking behind the prime mover.

1842 **Rationale:** This requirement enhances the safe operational characteristics of  
1843 both the prime mover and trailer.

1844 Mobility Degradation. While empty or fully loaded, the FTTS-MSV companion  
1845 trailer shall cause no decrease in the mobility characteristics of the prime mover.

1846 **Rationale:** This requirement ensures the FTTS-MSV with its companion  
1847 trailer is able to keep pace with other critical UA systems.

1848 Brakes.

1849 The FTTS-MSV companion trailer shall have a braking system that activates  
1850 when separated from the prime mover and shall hold the trailer on a 30 percent  
1851 longitudinal slope (in either direction) when uncoupled.

1852 The operator shall easily disengage this capability in the event the trailer must be  
1853 moved when uncoupled from the prime mover.

1854 The FTTS-UV companion trailer shall meet current military and federal motor  
1855 vehicle safety standards, such as FMCSR.

1856 It is necessary that the brake system be designed to allow for safe and effective  
1857 operation when coupled or uncoupled from the prime mover. A brake system  
1858 that activates when separated from the prime mover and can hold on a 30  
1859 percent slope is needed to allow positioning the trailer on uneven terrain and  
1860 ramps in Roll-On/Roll-Off (RO/RO) vessels. The operator must disengage the  
1861 brake system to permit repositioning the trailer when it is not appropriate or  
1862 required to use the prime mover.

1863 Coupling/Uncoupling. The FTTS-MSV companion trailer shall be capable of  
1864 being coupled/uncoupled by one soldier and free standing on both hard and soft  
1865 surfaces when fully loaded and not attached to the prime mover.

1866 **Rationale:** The prime mover will have a crew of one; therefore, it is essential  
1867 that only one soldier couple/uncouple the trailer to meet system emplacement  
1868 demands. The trailer must be free standing when uncoupled to allow for  
1869 autonomous operation.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1870 Expediency Towing. The FTTS-UV companion trailer shall capable of being  
1871 safely towed by the pintle of legacy trucks for emergency movement.

1872 **Rationale:** This requirement is needed to ensure compatibility with legacy  
1873 prime movers in the event it becomes necessary to tow the trailer with a legacy  
1874 truck in an emergency situation. It is recognized that such emergency operation  
1875 may require operation at a reduced performance level.

1876 Backing Truck-Trailer Combination. The FTTS-MSV companion trailer shall be  
1877 capable of being backed safely from any normal position (such as when in a turn  
1878 but not from full jackknife) without damage to truck, trailer, or payload, and  
1879 without necessity for operator dismounting or other preparation.

1880 **Rationale:** Safe backing of the truck with trailer is imperative to ensure safe  
1881 operation in both peacetime highway operations and wartime tactical operations.  
1882 Backing frequently becomes necessary to permit extrication from an untenable  
1883 situation or to improve a tactical operational position.

1884 Wheels. The FTTS-MSV companion trailer shall have lug nuts, tires and wheels  
1885 compatible with the FTTS-MSV.

1886 **Rationale:** This requirement is needed to reduce the logistic burden and to  
1887 improve operator maintainability of both vehicles. The ability to replace a truck  
1888 wheel with a wheel from the trailer may mean the difference between returning to  
1889 the security of the UA or being captured.

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1890 Annex E FCS Family of Systems

1891 Each FCS FoS (FTTS-MSV) platform must have an internally operated, self-  
1892 refueling capability that allows the platform to refuel itself or discharge its  
1893 internally stored fuel into another FCS platform or fuel storage receptacle within  
1894 30 seconds using automated/robotic means. Additionally, each FCS FoS  
1895 platform must be capable of open port, gravity refueling and be compatible with  
1896 the FCS refueling system, incorporating a locking fast-refuel capability and the  
1897 capability to draw fuel from a fuel cell. FTTS must be interoperable with legacy  
1898 and interim refueling systems. If multiple fuel tanks, complete refueling must be  
1899 accomplished from a single port.

1900 **Rationale:** Rapid, efficient resupply of the FTTS under all types of conditions  
1901 dictates that the system be capable of self-load. Cross-level capability ensures  
1902 that FTTS/FCS platforms requiring fuel to complete a mission can receive fuel  
1903 from other platforms. Gravity refuel allows FTTS platforms to use commercial or  
1904 emergency fuel sources if necessary

1905

## DRAFT

### Future Tactical Truck System – Maneuver Sustainment Vehicle

#### FTTS-MSV

#### Emerging Desired Capabilities

1906 Annex F Block items

1907 **341 Robotics.** FTTS-MSV shall incorporate the ability for each platform to  
1908 perform the duties of the lead vehicle or an unmanned follower with minimal  
1909 effort.

1910 **Rationale:** Personnel savings

1911 The FTTS-MSV platform shall include, for each crewman, one removable  
1912 Crewman's Wireless Remote Interface System (CWRIS) that can connect to the  
1913 C4ISR system, wirelessly from within the vicinity of the platform in a secure  
1914 mode. The CWRIS will be able to operate without recharging for four hours of  
1915 continuous use. The CWRIS cradle within the FTTS-MSV must provide a  
1916 recharging capability. The CWRIS will contain the Army's training management  
1917 system, the Scenario Generation System, Standard Army SAF and an image  
1918 generation and display capability. It will also be capable of either displaying a  
1919 duplicate image of the on-board command and control interface or the user  
1920 interface for reach back training. To communicate effectively with local  
1921 populations, the CWRIS will have a language translation capability (Text and  
1922 Voice). The CWRIS, when connected by wire (e.g., Ethernet) to other CRWIS's  
1923 will be capable of stand-alone, 'desktop', virtual collective training.

1924 **Rationale:** While the Embedded Training capabilities are enabled for on-  
1925 vehicle performance, it is unrealistic to require all training and training  
1926 management functions to be performed on vehicle all the time. Further, some  
1927 battlefield functions (e.g., maintenance, observation post duties, and interaction  
1928 with local populations) are performed in the vicinity of the vehicle. A CWRIS is a  
1929 multi-functional device that will support performance of off-vehicle / near-vehicle  
1930 battlefield functions while recognizing the peacetime reality of off-vehicle training  
1931 and training management.

1932
