

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1 In an effort to make this document easy to use and understand, the  
2 requirements for the FTTS have been organized into levels. The capability  
3 requirements common to the FTTS platforms are listed in the base document.  
4 Annexes have been attached to the base document to provide organization to  
5 the detailed requirements. At each successive level, the requirements become  
6 more focused to individual system-unique requirements. Annex structure is  
7 shown at table \_\_\_\_.

8  
9

10

11 FTTS blocking strategy is still in development/refinement. For the purposes of  
12 preparation for Milestone B decision, the FTTS requirements will be displayed  
13 with the threshold as the minimum acceptable operational value below which the  
14 utility of a system becomes questionable and the objective being the full objective  
15 capability.

16 **Definitions.** The following definitions apply unless otherwise stated:

17 **Curb Weight (CW)** = Empty vehicle, full fuel, lubricants, coolant, and BII.

18 **Gross Vehicle Weight (GVW)** = CW plus the weight of 2 soldiers (4 soldiers  
19 desired) and their individual equipment and weapons, trailer tongue weight (10  
20 percent of the towed load GVW), crew compartment protection kit, and payload  
21 (payload includes mission essential support equipment, unique digital appliqué,  
22 and non-mission essential kits, such as cargo compartment heater kit and cargo  
23 compartment protection kit). The planning factor per soldier with individual  
24 equipment is 343 pounds (weight estimates per Brigade Combat Team  
25 developmental weights).

26 **Gross Combined Weight (GCW)** = GVW plus weight of the towed load. All  
27 characteristics requiring evaluation at GCW shall be performed using the FTTS-  
28 UV companion trailer at its maximum payload as well as towed loads required for  
29 specific mission applications.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

30 **System Performance.** Unless otherwise specified, the following characteristics  
31 apply to all FTTS-UV versions at GCW towing a representative trailer weighing  
32 (TBD) pounds having a tongue weight of (TBD) pounds over the Operational  
33 Mode Summary/ Mission Profile (OMS/MP) speed and terrain profiles. Following  
34 are the system operational performance parameters (capabilities and  
35 characteristics):

#### 36 Design Characteristics:

##### 37 **Responsiveness.**

38 **FCS information and sustainment systems** (FTTS-UV) must support the  
39 simultaneous, multi-modal insertion of UA forces into multiple austere points of  
40 entry without reliance on fixed ports and staging bases.

41 **Rationale:** The Combatant Commander must have the ability to employ the  
42 UA using multiple points of entry with its organic command and control and  
43 sustainment systems that will allow unity of command and effort while dispersed.  
44 This requires the introduction of the UA at multiple points of entry that are  
45 unpredictable to overcome enemy access denial, to be able to leverage austere  
46 points of entry to increased force flow, to increase transport options available to  
47 the combatant commander. Analysis shows that the enemy, using asymmetric  
48 means, can inflict heavy damages before we are ready to fight, during  
49 conventional Reception, Staging, and Onward movement and Integration  
50 (RSO&I). We need the capability to operate without the requirement for  
51 elaborate APODs and SPODs, as well as the ability to project forces ready to  
52 fight. Entry into an austere theater, through multiple unimproved points without  
53 relying on fixed ports and staging bases, mitigates problems of enemy access  
54 denial strategies.

55 **Range** The FTTS-UV shall be capable of operating on internally carried fuel for a  
56 minimum distance of at least 600 miles (T), 900 miles (O), at GCW across the  
57 OMS/MP. Internally carried fuel includes all fuel tanks at no more than 95  
58 percent full, with 5 percent allowed for ullage. The FTTS-UV shall be capable of  
59 operating for an additional distance of at least 100 statute miles with the  
60 additional fuel reserves carried in standard Army containers and transported  
61 externally on mounting brackets provided as a kit. Upon arrival, the FTTS-UV  
62 must support the UA capability to conduct distributed and continuous 24-hour  
63 operations, self-sustained, for a minimum of three days with out requiring  
64 reception and staging.

65 **Rationale.** The range will ensure that the FTTS-UV has the ability to  
66 sustain itself for 72 hours without re-supply in a high intensity battle and another  
67 four days in a low intensity environment and maintain momentum with the UA on  
68 the battlefield. The fuel container mounting kit enables anyone who needs the  
69 additional fuel capacity to have the means to transport it without detracting from

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

70 space required by their payload. Upon arrival, UA combat units immediately  
71 employ over operational distances (up to 400 km) to designated area(s) of  
72 operations a coherent, integrated combined arms team with the ability to conduct  
73 their core mission tasks with an area of influence of 75 km radius (150 km  
74 diameter) and area of interest of 150 km radius (300 km diameter).

75 **Payload.** The FTTS-UV shall have a payload of at least 4000 pounds  
76 (Threshold) and/or 5000 pounds (Objective) excluding full internal fuel,  
77 lubricants, coolants, 2 soldiers (Threshold) (3 soldiers – Objective) and their  
78 individual equipment and weapons, and Basic Issue Items (BII).

79 **Rationale.** In order to support the Objective Force Mission loads, the  
80 FTTS-UV must be capable of transporting required mission weight. Limitations  
81 placed upon the space and weight of the systems will thereby ensures no  
82 compromise in the soldier space in the TWV.

#### 83 **Crew Compartment.**

84 **Primary Crew Seats.** The FTTS-UV shall have at least two primary crew seats  
85 (Threshold) (three primary crew seats or a bench - Objective), or another  
86 variation thereof which provides equivalent required seating. This seating shall  
87 provide ergonomic support to provide leg, back, shoulder, and head support.  
88 The driver's seat shall be adjustable to accommodate 5<sup>th</sup> to 95<sup>th</sup> percentile  
89 soldiers.

90 **Rationale.** Ergonomically designed seats are needed to combat driver  
91 fatigue and support extended tactical operations. The Objective three-seat  
92 configuration permits transporting the three-soldier communications crew with  
93 their shelter without the need for an extra vehicle. An adjustable driver's seat is  
94 needed to accommodate the variation in sizes of the potential military drivers.

95 **Secondary Crew Seating.** Seating for at least two additional soldiers shall be  
96 provided for use in such missions as command and control and radio relay  
97 operations. The seating shall be separately foldable flush into the deck. This  
98 seating shall provide ergonomic support to provide leg, back, shoulder, and head  
99 support.

100 **Rationale.** Four personnel are required for the command and control  
101 function; therefore, seating for at least two additional soldiers is required. The  
102 FTTS-UV is expected to perform a wide range of missions; therefore, seating  
103 which folds into the deck is needed to permit ease of vehicle reconfiguration and  
104 maximizing cargo deck space while still retaining the seats on the vehicle for  
105 future use and separately foldable increases flexibility. The ergonomically  
106 designed seats are needed to increase the potential for the occupants arrive at  
107 destination in a combat ready state.

#### 108 **Crew Safety.**

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

109 **Individual Weapons Stowage.** The FTTS-UV shall have readily accessible  
110 quick release, individual weapons stowage (for all versions of the M-16, Squad  
111 Automatic Weapon (SAW), M4 Carbine, M203, and the Objective Individual  
112 Combat Weapon (OICW)) for up to four soldiers (Threshold) (five soldiers –  
113 Objective) without interfering with the operating functions, controls for vehicle  
114 operation, internal equipment controls, and entry/exit doors.

115 **Rationale.** The occupants' individual weapons must be readily accessible  
116 in the event of enemy contact but must be secured so as not to be missiles in  
117 event of an accident or rough cross-country operations and located so as to not  
118 interfere with internal vehicle operations.

119 **Survivable Space.** The FTTS-UV shall have a cab design that provides  
120 sufficient survivable space during an accident for up to four occupants (T), 5(O)  
121 in the primary and secondary-seating areas.

122 **Rationale.** Adequate cab protection is needed to prevent the occupants  
123 from being crushed in an otherwise survivable accident.

124 **Cargo Compartment Seating.** A troop seat kit shall be provided to permit  
125 transporting at least eight combat equipped soldiers in the cargo compartment.  
126 Seats shall permit the soldiers to face inboard as well as outboard based on the  
127 tactical situation.

128 **Rationale.** The FTTS-UV is required to transport troops in some instances  
129 (e.g., in the event of the demise of an FCS Infantry Combat Vehicle (ICV)).  
130 Design of the troop seat kit to transport at least eight combat equipped soldiers is  
131 needed to enable the FTTS-UV to transport a complete ten-man squad. Tactical  
132 situations commonly require that seated soldiers face outboard with their  
133 weapons at the ready while being transported by FTTS-UV in the battle zone.

134 **Occupant Accommodations.**

135 **Operating Environment.**

136 **Crew Compartment Operating Environment.** The FTTS-UV shall have  
137 internal environmental control measures to ensure personnel can work in the  
138 vehicle for extended periods of time. For systems with the crew compartment  
139 protection kit installed; cab-cooling requirements shall be met with windows  
140 closed. (A kit may be used to meet this requirement. If a kit is used, it shall be  
141 installed at field level or below.)

142 **Rationale.** This vehicle will be operated throughout the world as  
143 exigencies dictate. The FTTS-UV crew may be required to perform in  
144 temperatures as high as 120 degrees F and as low as -50 degrees F. Prolonged  
145 exposure to these temperatures can cause extreme fatigue and or permanent  
146 physical injury. The FTTS-UV needs to allow for sustained operations in daylight

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

147 and darkness and while the crewmembers are wearing MOPP IV gear (10 hours  
148 of continuous operation) to ensure that the crew of the FTTS-UV remains mission  
149 capable. When the armor protection is installed, windows must be kept closed to  
150 maintain ballistic protection; hence, the need for cab cooling with windows  
151 closed. Use of a kit to provide a safe and comfortable cab-operating  
152 environment may be more cost effective than equipping all vehicles with this  
153 capability from the factory.

154 **Cargo Compartment Operating Environment.** The FTTS-UV cargo  
155 compartment shall have internal environmental control for personnel working in  
156 vehicle for extended periods of time. (A kit may be used to meet this  
157 requirement. If a kit is used, it shall be installed at Field Maintenance level or  
158 below.)

159 **Rationale.** The FTTS-UV will be operated throughout the world as  
160 exigencies dictate. The FTTS-UV cargo compartment may routinely be used for  
161 troop transport operations in temperature environments ranging from as high as  
162 120 degrees F to as low as -50 degrees F. Prolonged exposure to these  
163 temperatures can cause extreme fatigue and or permanent physical injury. The  
164 FTTS-UV must allow for safe and comfortable sustained operations in daylight  
165 and darkness and while the troops in the cargo compartment are wearing MOPP  
166 IV gear (10 hours of continuous operation) to ensure that soldiers riding in the  
167 cargo compartment of the FTTS-UV remain mission capable. Use of a kit to  
168 provide a safe and comfortable cargo compartment for troop transport may be  
169 more cost effective than equipping all vehicles with this capability from the  
170 factory.

171 **Vehicle Control Enhancement (VCE).** The FTTS-UV shall include active and  
172 passive vehicle control enhancements (e.g., integrated seat and restraint  
173 systems, improved brakes, traction control, etc.) that provide for maximum  
174 control of the vehicle during the full range of vehicle mission profile to include off-  
175 road use and emergency conditions. These enhancements shall also allow the  
176 FTTS-UV to exhibit safe stability and handling characteristics at all speeds, up to  
177 and including maximum speed, during normal and emergency lane change  
178 maneuvers.

179 **Rationale.** Control enhancement provides for safer operation of the vehicle  
180 when operated closer to the design limits of the FTTS-UV. This will provide for a  
181 more safe, effective, and efficient vehicle when operated across the mission  
182 terrain profile. Also, it is expected that the FTTS-UV will be operated on public  
183 highways around the world where lane change operations at varying speeds will  
184 be a routine occurrence. Additionally, emergency conditions may require rapid  
185 lane change corrections. Army drivers of all levels of experience and training

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

186 backgrounds will drive the FTTS-UV; therefore, the vehicle must not exhibit any  
187 unusual or unsafe characteristics.

188 **Crew Restraint System.** Each occupant seat (seats in the primary and  
189 secondary seating areas but excluding troop seats and ambulance kits) shall  
190 have modern integrated safety restraint equipment, active/passive, when  
191 operated over the full vehicle mission profile, to include off-road use, at rated  
192 speeds. This system shall accommodate a soldier wearing full combat gear (to  
193 include LBE, personal body armor, and protective mask) and individual MOPP IV  
194 protective gear without interfering with vehicle or crew operation and shall  
195 provide quick release egression from the vehicle in emergency or contingent  
196 situations. In addition, the restraint system shall also not interfere with the active  
197 and passive VCE.

198 **Rationale.** The stated requirements provide for the required Federal level  
199 of safety as well as enhance operator control of the vehicle across the expected  
200 terrain profile. The restraint system must be designed to allow a combat ready  
201 soldier to operate the vehicle throughout the battlefield environment, to include  
202 NBC contaminated areas, without impact on operability of the vehicle.  
203 Integrating the personal restraint system into the seat provides a more thoroughly  
204 unified system that will enhance personnel convenience and usage as well as  
205 accommodate a wide variety of operator/crew sizes.

206 **Vehicle Security.** The FTTS-UV shall have a means to provide vehicle security  
207 (e.g., door locks, locking hatches and fuel tanks, etc.). The security system shall  
208 provide the capability to lock the entry points from inside the vehicle without  
209 inhibiting a quick exit from the vehicle. When the FTTS-UV is locked from the  
210 outside, it shall be in compliance with requirements for securing communications  
211 equipment when vehicle is unattended, but shall not inhibit quick exit from the  
212 inside.

213 **Rationale.** Vehicle security is needed to prevent unauthorized access to  
214 the interior of the vehicle during operations while allowing rapid exit of the  
215 occupants in the event of an emergency. Vehicle security is also required to  
216 prevent unauthorized access to vehicle equipment when vehicle is unattended.

217 **Operations Using Arctic and MOPP IV Clothing.** While wearing individual  
218 arctic protective clothing and MOPP IV protective gear, under anticipated  
219 operational conditions, the crew and maintainers shall be able to conduct safe,  
220 effective, and efficient operations and maintenance on the vehicle, with or without  
221 towed loads.

222 **Rationale.** The FTTS-UV will be subject to use in a wide variety of weather  
223 and tactical conditions. Soldiers must be capable of operating and maintaining  
224 the vehicle while wearing cold weather and NBC protective clothing.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

225 **Load Towing Characteristics.**

226 **Companion Trailer Towing.** The FTTS-UV shall be capable of safely towing,  
227 over the FTTS-UV OMS/MP, the FTTS-UV companion trailer.

228 **Rationale.** The FTTS-UV needs to be able to safely tow the companion  
229 trailer to ensure all UA systems using an FTTS-UV trailer as an Associated  
230 Support Item of Equipment (ASIOE) can be relocated on the future battlefield.

231 **Backward Compatibility.** The FTTS-UV shall be able to safely tow, over the  
232 FTTS-UV OMS/MP. Achieved speeds of the FTTS-UV and towed system  
233 combination shall be equal to or greater than those achieved by the predecessor  
234 TWV and the same towed system.

235 **Rationale.** The FTTS-UV must be backward compatible with the existing  
236 light vehicle towed loads to ensure all mission-required equipment will be  
237 adequately supported on the future battlefield. It is recognized that such  
238 operation may result in reduced FTTS-UV performance level to be compatible  
239 with the towed load.

240 **Towed Load Brake Control.** When applicable, the FTTS-UV shall have the  
241 capability for positive control of towed system brakes.

242 **Rationale:** Future military trailers/towed weapons systems that operate in  
243 both directions are expected to have positive braking systems to avoid mobility  
244 degradation and safety hazards caused by surge brakes. This requirement will  
245 ensure future compatibility.

246 **Towed Load Power and Control.** When applicable, the FTTS-UV shall be  
247 capable of providing power and active control of the towed load.

248 **Rationale:** Future military trailers/towed weapons systems may have  
249 integral motors that provide enhanced off-road mobility. This requirement will  
250 ensure compatibility with this type system.

251 **Second Pintle.** The FTTS-UV shall have the capability to mount a second pintle  
252 on the front of the vehicle. The pintle may be demountable for use on both front  
253 and rear of the vehicle.

254 **Rationale:** A front mounted pintle is needed to facilitate combat loading  
255 of trailers/ howitzers in U.S. Air Force aircraft and on US Navy and Army  
256 watercraft and to provide ease of trailer/howitzer emplacement in field positions,  
257 and aircraft relocation on the airfield.

258 **C4I**

259 The FTTS information system must provide all manned systems the ability to  
260 integrate into a joint, secure, mission planning and rehearsal system from alert  
261 through deployment to employment and connectivity into the gaining command's

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

262 C4ISR architectures during movement by air, land and sea. The system must  
263 interface with the COP and Defense Transportation System (DTS) to allow the  
264 Joint Task Force (JTF) to adjust responsiveness and adapt to a dynamic Joint  
265 Operational Area (JOA).

266 **Rationale:** Supports mission planning, mission rehearsal, battle command,  
267 and ability to integrate into gaining C2 architectures during movement by air, land  
268 and sea. FCS-equipped UA will operate as part of a Joint Team across  
269 DOTMLPH. The FCS FoS supports top-level Information Exchange  
270 Requirements (IER) detailed in Appendix J of the FCS ORD to enable the  
271 exchange of information vertically and horizontally, from alert through  
272 deployment and employment, to conduct operations with Joint forces. Given Joint  
273 Communications support and bandwidth between JTF, intervening HQ as  
274 established, and UA, accomplish 100% IER information exchange (Threshold)  
275 with achievement of IER information exchange time standards (Objective).

276 Systems PMs shall integrate with the Common Relevant Operating Picture  
277 (CROP) via embedded C4I equipment on the FTTS-UV to include different types  
278 of suites, architectures, network peripherals, subsystems, and radios. The  
279 FTTS-UV shall have sufficient space and power for on-board integration of  
280 C4ISR systems without inhibiting any vehicle operation by any operator within  
281 the cab space of the FTTS-UV (to include line of sight, safety issues,  
282 MANPRINT, ergonomics, etc...) or without using room dedicated for TA-50,  
283 individual weapons, rucksack/backpack storage, crew gear, duffle bags, or other  
284 cab occupant belongings.

285 **Rationale:** Network centricity is an underlying principal of the Objective  
286 Force.

287 The FTTS-UV shall have onboard signature management to counter the enemy's  
288 ability to acquire and engage our forces. They must have passive and active  
289 survivability capabilities to detect and counter an enemy's acoustic, visual, and  
290 electromagnetic acquisition means.

291 **Rationale:** The FTTS-UV must have the same signature management  
292 capabilities as the forces it supports.

#### 293 **Deployability.**

294 The FTTS-UV and its companion trailer shall be transportable worldwide without  
295 disassembly and without shoring at its gross combined weight (GCW) by  
296 highway, rail, water, and air modes up to the allowable payload and dimensional  
297 limits of each respective transport carrier without waivers. When transported at  
298 GCWR, the trailer with load or empty will stay connected to the prime mover with  
299 load or empty as the situation allows.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

300 **Rationale:** Increases the options available to the Combatant Commander for  
301 entering forces into theater and maximizes force flow using multiple entry points  
302 to bring in combat configured units, enabling responsive operational and tactical  
303 movement and maneuver in support of distributed operations. This capability  
304 improves not only our entry capability but also the continued flow of forces later  
305 in the campaign for decisive operations. Transporting the FTTS-UV and its  
306 companion trailer with a maximum payload will decrease the number of trucks  
307 and/or supply loads needed to accomplish a mission.

308 The FTTS-UV and its payload shall not require more than 15 total minutes to  
309 prepare for embarkation or debarkation on any form of transport (air, land, or  
310 sea).

311 **Rationale:** The Unit of Action will rely on unit integrity and rely less on  
312 lengthy embarkation/debarkation time when deploying to an Area of Operation.  
313 The FTTS-UV can not cause combat ineffectiveness due to increased prep time  
314 or time due for mission configuration/re-configuration.

315 The FTTS-UV and its companion trailer shall be deployable on participating VISA  
316 ships.

317 **Rationale:** VISA ships will be used to deploy forces and equipment when  
318 military or other government transportation means are not available.

#### 319 **Transportability**

320 The FTTS-UV and its companion trailer shall have sufficient and clearly marked  
321 non-removable lift and tie-down provisions able to support the lifting or tie-down  
322 of the FTTS-UV at GVW on any acceptable means of transport (i.e. ship, aircraft,  
323 trailer, railcar, etc...) and without use of special lifting slings or tie-down devices.

324 **Rationale:** The FTTS-UV and its companion trailer may be loaded with  
325 maximum payload when transported or moved via lifting. Clearly marked points  
326 will allow workers to identify correct points on the FTTS-UV and companion  
327 trailer to use, thereby precluding unnecessary damage while transporting the  
328 FTTS-UV and companion trailer.

329 The FTTS-UV shall at GCW and GVW negotiate a 15 degree approach angle  
330 and break-over (departure) angle without overloading axle or floor loads both  
331 forwards and backwards while egressing / ingressing without need for special  
332 ramps, blocking or bracing, or other dunnage and without any part of the FTTS-  
333 UV or trailer except for the tires touching the ground, ramp or compartment  
334 (cargo) area/floor.

335 **Rationale:** The FTTS-UV and companion trailer will be transported on ships  
336 and aircraft with ramp angles up to and including 15 degrees. Preclusion of  
337 dunnage or other materiel expedites the embarkment/debarkment time. C-130

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

338 Logistics Rails. At no time during loading, flight, or off loading shall any portion of  
339 the FTTS-UV vehicle make contact with the C-130's logistics rails.

340 **Rationale:** If the FTTS-UV were to contact the rail system, damage could be  
341 done to the FTTS-UV or the rails and make either non-mission capable.

342 **Air.**

343 **Fixed Wing Air Transportability.** The FTTS-UV shall be air transportable at  
344 GCW (without demounting subsystems/shelters) by C-130 and larger aircraft. A  
345 minimum of three FTTS-UV vehicles at GVW (without demounting subsystems/  
346 shelters) shall be transportable by C-130 aircraft.

347 **Rationale.** The FTTS-UV must be capable of being loaded on C-130 and  
348 larger aircraft with its trailer/howitzer to facilitate rapid loading and unloading of  
349 the aircraft. A minimum of three FTTS-UV vehicles on a C-130 aircraft is  
350 required to ensure no increased air transport is required above that of the current  
351 light fleet.

352 **Low Velocity Aerial Delivery (LVAD).** The FTTS-UV shall be capable of LVAD  
353 (shelter demounted, if applicable) by: 1) C-130 at GVW, excluding crew, without  
354 towed load, and 2) C-17 at GVW, excluding crew, with and without towed load. It  
355 is the user's Objective that the FTTS-UV plus towed howitzer be capable of  
356 LVAD on standard Type 5 airdrop platforms configured to 32-foot length. After a  
357 successful LVAD, vehicle shall be ready for operation in 15 minutes (excluding  
358 shelter remounting time) (Threshold) (10 minutes or less - Objective), after  
359 removal of LVAD rigging.

360 **Rationale:** The FTTS-UV must be capable of LVAD in support of rapid  
361 deployment forces and airborne operations, especially with the light howitzer.  
362 Use of standard type five airdrop platforms configured to 32-foot length  
363 eliminates the need to develop a new LVAD platform for this vehicle/howitzer  
364 combination. Ready for operation times ensure that the system can clear the  
365 drop zone and commence mission operations in a timely fashion.

366 **Rotary Wing Transportability.**

367 **CH-47 Aircraft.**

368 **External Transport.** The FTTS-UV, at GVW (without dismounting  
369 subsystems/shelters to include ambulance kits), shall be individually externally  
370 transportable (sling-load) by CH-47 at GCW and at GVW in tandem with the  
371 towed howitzer at 4,000 feet above sea level and 95 degrees Fahrenheit (F), 30  
372 Nautical Miles (NM) radius of action (Threshold) (60 NM – Objective). Crew,  
373 cargo/ammunition shall be loaded in the aircraft up to the payload of the aircraft.

374 **Rationale.** Simultaneous external transport enables rapid employment of  
375 the FTTS-UV and weapon or trailer towed load and makes more efficient use of

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

376 time and transport assets. Rigging procedures designed for this type vehicle  
377 should be standard dual point rigging procedures presently employed by the  
378 Army today.

379 **Internal Transport.** (Objective) The FTTS-UV and its companion trailer, each  
380 at GVW, shall be internally transportable by CH-47.

381 **Rationale.** Internal transport is required to maximize the operational  
382 effectiveness of the light forces and Special Operational Forces (SOF). *(NOTE*  
383 *for Future Reference: The Infantry School requested this requirement be a*  
384 *Threshold rather than an Objective requirement. Requires additional*  
385 *rationale.*

386 **UH-60 Aircraft.**

387 The FTTS-UV shall be transportable by the latest model of the UH-60 at 4,000  
388 feet pressure altitude and 95 degrees F, 30 NM radius of action (Threshold) (60  
389 NM – Objective) at curb weight with two combat equipped soldiers and two  
390 combat net radios (Threshold) (with winch, four combat equipped soldiers, two  
391 combat net radios and camouflage netting - Objective).

392 The FTTS-UV companion trailer shall be transportable by the latest model of the  
393 UH-60 at 4,000 feet pressure altitude and 95 degrees F, 30 NM radius of action  
394 (Threshold) (60 NM – Objective) at trailer GVW.

395 **Rationale.** Helicopter transport provides operational flexibility for the Light  
396 Forces. Transport of the FTTS-UV in this configuration by the UH-60 gives the  
397 Light Forces the capability of rapid movement of combat assets.

398 **Tilt-Rotor Aircraft (MV-22).**

399 **External Transport.** At GVW and without demounting subsystems, the FTTS-  
400 UV shall be individually externally transportable (either single or dual point sling-  
401 load) by MV-22 (with nose gun) at 3,000 feet above sea level cruise altitude,  
402 takeoff/landing from sea level, and 91.5 degrees F cruise, for a 100 NM radius of  
403 action. Vehicle, crew, and payload may be adjusted so as not to exceed aircraft  
404 limit of 8,400 pounds (at 100 NM radius), 10,000 pounds (at 50 NM radius) or  
405 11,600 pounds (ship to ship transfer at less than 1 NM radius).

406 **Internal Transport.** (Objective) The FTTS-UV and its companion trailer, each  
407 at GVW, shall be internally transportable by MV-22.

408 **Rationale.** External transport enables rapid employment of the FTTS-UV  
409 and payload and makes more efficient use of time and transport assets. Land  
410 Assault-External lift profile is assumed. Ship to Objective Maneuver (STOM)  
411 concept currently calls for aircraft to launch from 50 NM out from the shore. If  
412 one assumes 50 NM inland transit, this is how the 100 NM radius was derived.  
413 The Objective internal transport allows for movement of SOF vehicles.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

414 **External Air Transport (EAT) Survivability.** The FTTS-UV and its companion  
415 trailer shall be designed to withstand, without damage, the forces imposed by the  
416 wind at the maximum safe external load airspeed of the CH-47, UH-60, and MV-  
417 22 (Threshold) (maximum airspeed of the aircraft - Objective).

418 **Rationale.** The pilot should not have to limit the speed of the aircraft  
419 because of concern about wind damage to the FTTS-UV or its trailer at the  
420 aircraft's maximum external load airspeed.

421 **Surface Transport.** The FTTS-UV at GCW, GVW, and CW and the FTTS-UV  
422 companion trailer at GVW and CW shall:

423 Meet highway legal limits, without waivers or special permits, for all countries in  
424 which the FTTS-UV will be operated (current military installations and  
425 deployment sites both stateside and abroad).

426 Have military standard lifting and tie-down provisions to allow for loading and  
427 securing on all authorized means of transport.

428 Be rail transportable worldwide. Rail transport at GCW shall be performed with  
429 the towed load coupled to the FTTS-UV.

430 Be marine transportable by LCM-8, and larger vessels/ships to include RO/RO  
431 vessels.

432 **Rationale.** All vehicles must adhere to highway legal load limits, vehicle  
433 size restrictions, and towed load restrictions, wherever they may operate to  
434 eliminate need to obtain special permits. Military standard lifting and tie-down  
435 provisions are essential for safe and efficient shipping of the FTTS-UV and its  
436 companion trailer by rail, sea, and air. Transport by LCM-8, and larger  
437 vessels/ships is required for Logistics Over-the-Shore operations (LOTS). The  
438 RO/RO vessel compatibility is needed to permit worldwide shipment.

439 **Agility.**

440 **Gradability.**

441 **Longitudinal Slopes.** The FTTS-UV at GVW (Threshold) (GCW - Objective)  
442 shall be capable of ascending/descending, starting, and stopping on dry, hard-  
443 surfaced longitudinal slopes up to and including 60 percent. At GCW, the FTTS-  
444 UV shall be capable of ascending/descending, starting, and stopping on dry,  
445 hard-surfaced longitudinal slopes up to and including 40 percent (Threshold) (60  
446 percent - Objective). At GCW, the FTTS-UV shall be capable of holding in either  
447 direction on a 30-percent longitudinal slope (Threshold) (40-percent - Objective)  
448 using only the FTTS-UV parking brake with the engine off and the transmission in  
449 neutral. Longitudinal slope operation shall be performed in both ascending and  
450 descending directions without loss of stability, malfunction, or degradation of  
451 stated requirements. The engine off times shall be of such long duration as to

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

452 assure that there shall be no loss of fluids or other malfunction while parked on  
453 the slope.

454 **Rationale.** Steep terrain (with slopes up to 60 percent) will be encountered  
455 in operational areas around the world. Negotiating these slopes is essential for  
456 the emplacement of towed weapons, communications shelter systems, and  
457 overall battlefield maneuverability. Adequate brakes are necessary for safe  
458 control on slopes. The ability to stop, park, and restart on longitudinal slopes is  
459 necessary to ensure adequacy of parking brakes and engine fuel and lubrication  
460 systems and to permit full operation on RO/RO vessels. Achievement of the  
461 Objective will allow for a safety margin during operations in rolling sea conditions  
462 where the angle may vary.

463 **Side Slopes.** The FTTS-UV and its companion trailer, both at GVW, shall be  
464 capable of traversing side slopes up to and including 40 percent. Side slope  
465 operation shall be performed with either side of the vehicle facing up slope and  
466 without loss of stability or malfunction/degradation of stated requirements or loss  
467 of vehicle fluids.

468 **Rationale:** With the variety of worldwide deployment locations, operations  
469 with side slopes up to 40 percent will be encountered. Negotiating these slopes  
470 is essential for overall battlefield maneuverability. It is essential the FTTS-UV  
471 and its companion trailer be safe, stable platforms while negotiating these slopes.

472 **Speed on Grade.** The FTTS-UV and its companion trailer both at GVW shall be  
473 capable of ascending a 5-percent grade at 55 MPH (Threshold) (60 MPH –  
474 Objective):

475 **Rationale.** Meeting this requirement ensures adequate motive power for  
476 operations in hilly to mountainous terrain and is in consonance with the  
477 capabilities of predecessor vehicles. Achievement of the Objective speeds will  
478 increase the combat effectiveness of the unit as the assets are relocated on the  
479 battlefield.

480 **Fording.** The FTTS-UV and its companion trailer both at GVW shall be capable  
481 of fording a salt or fresh water obstacle, not less than 40 inches in depth  
482 (Threshold) (60 inches in depth – Objective), at speeds of at least 5 mph, without  
483 preparation or kits and without any increased after-action maintenance  
484 requirements.

485 **Rationale.** Provides operational flexibility to maneuver over a wide variety  
486 of terrain and natural water obstacles. Reduces the need for integral or  
487 augmented engineer mobility support assets. Maintains the momentum of the  
488 force during maneuver by limiting obstacles that require augmented support to  
489 negotiate. Fording is required to allow operations where water obstacle crossing  
490 and amphibious landings are required. Fresh and salt-water requirements

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

491 ensure the vehicles are properly designed to withstand the most vigorous of  
492 environmental conditions. The 40 inches (Threshold) (60 inches - Objective)  
493 requirement ensures the system can operate in consonance with the FCS.  
494 Inability to achieve this capability will result in the fielding of a vehicle that is less  
495 capable than the maneuver forces it must support, thus adversely affecting the  
496 maneuver commanders ability to maneuver, employ, and control his forces.

#### 497 **Mobility.**

498 **Forward Speed.** The FTTS-UV at GVW shall be capable of a minimum speed of  
499 75 MPH in the forward direction on a dry, level, hard surface road to provide  
500 operational capability to meet mission needs.

501 **Rationale.** The FTTS-UV must achieve the performance speed of the  
502 fastest predecessor system to ensure no loss of current battlefield mission  
503 capability. Currently 1113 has a capability of 72 MPH and the Up-armored  
504 HMMWV has capability of 62 MPH.

505 **Acceleration.** The FTTS-UV at GVW and on a dry, level, hard surface road  
506 shall meet or exceed the acceleration characteristics of the quickest predecessor  
507 platform.

508 **Rationale.** The FTTS-UV requires sufficient forward acceleration to  
509 operate as a light tactical wheeled platform which shall ensure rapid get-away  
510 capability under hostile fire situations.

511 The FTTS-UV at GVW must be capable of a dash speed which is characterized  
512 by the ability to accelerate from 0 to 48 kph (30 mph) on level hard terrain within  
513 12 seconds (threshold)/10 seconds (objective). The FTTS-UV will be able to  
514 repeat this acceleration at least ten times in succession.

515 **Rationale:** Required to provide additional survivability to soldiers facilitating  
516 agile movements to destroy enemy forces or avoid engagements. Dash speed is  
517 based on known threats, engagement ranges, and time of flight for anti-tank  
518 guided missiles (ATGMs).

519 **Soft Soil Traversing Characteristics.** The FTTS-UV shall have equal or better  
520 Mobility Rating Speed (MRS) and percent GO/NO-GO than the FCS or most  
521 mobile predecessor tactical wheeled vehicle platform, (TWVP).

522 **Rationale.** The FTTS-UV must have sufficient soft soil mobility to keep  
523 pace with the FCS in UA operations as well as retaining current survivability  
524 characteristics inherent in the mobility of the predecessor TWVP

525 **Vertical Step.** The FTTS-UV at GVW shall be capable of climbing, in forward  
526 and reverse, a vertical obstacle of 32 inches (Threshold) (40 inches – Objective)  
527 in height without preparation of modification of the vehicle.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

528 **Rationale.** The ability to traverse cross-country areas requires the FTTS-  
529 UV to over-ride linear obstacles in its path. These features include boulders,  
530 logs, rice paddy dikes, washes, ditches, and other man-made obstacles. This  
531 requirement is needed to ensure the FTTS-UV meets the mobility requirements  
532 for percent GO/NO-GO as well as allowing it to traverse obstacles crossed by  
533 FCS. Attaining the Objective characteristics will improve the mobility of the  
534 system increasing its combat effectiveness.

535 **Trench Crossing (Objective).** The FTTS-UV shall be capable of navigating  
536 obstacles which include the following: gaps >3 meters wide, slopes > 60 percent  
537 and vehicle cone index < xx, in addition, manmade obstacles, CBRN obstacles,  
538 civilian population obstacles and final protective obstacles.

539 **Rationale.** Maintaining momentum on the future battlefield will be a key  
540 element to the success or failure of the FCS/UA force. Standoff mine, obstacle,  
541 IED, and booby trap detection, identification, characterization and reporting  
542 enhances tactical mobility and operational momentum. Obstacles include natural  
543 terrain obstacles (gaps >3 meters wide, slopes > 60 percent and vehicle cone  
544 index < xx), manmade obstacles, CBRN obstacles, civilian population obstacles  
545 and final protective obstacles.

546  
547 The FTTS-UV shall allow the operator to safely control the vehicle in the event of  
548 sudden power loss.

549 **Rationale:** Steering and braking capability not dependent on a powered  
550 system will give the operator the capability to safely control the vehicle.

551 **Ride Quality.** The FTTS-UV versions shall meet the ride quality requirements at  
552 GVW and at CW plus 2 occupants.

553 **Ride Limiting Speed.** The FTTS-UV shall attain no more than 6 watts average  
554 vertical absorbed power, as measured at the occupants' location as well as the  
555 entire cargo compartment of the FTTS-UV and its companion trailer, while  
556 negotiating the following Root Mean Square (RMS) ride courses at speeds listed  
557 below, with the tires at normal tire pressure (cross-country tire pressure, if  
558 equipped with a Central Tire Inflation System [CTIS]).

559

#### 6-Watt Speeds (MPH)

Version	RMS (inches)			
	1.0	1.5	2.0	2.5
GVW	30	20	15	13
CW plus 2 Occupants	25	18	13	11

560

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

561 **Vertical Acceleration.** The FTTS-UV shall sustain no more than 2.5-G peak  
562 vertical acceleration, as measured at the occupants' location as well as the entire  
563 cargo compartment of the FTTS-UV and its companion trailer, while negotiating a  
564 non-deformable, half-round obstacle at the rated speed as listed below with the  
565 tires at normal tire pressure (cross-country tire pressure, if equipped with a  
566 CTIS).

567

#### Obstacle Crossing Speeds (MPH)

Version	Obstacle Height (inches)			
	4	6	8	10
GVW	50	16	15	5
CW plus 2 Occupants	45	18	15	10

568

**Rationale.** Needed to provide a ride quality that permits continuous  
569 operations in most areas without serious detrimental effect on the occupants and  
570 equipment.

571

**Influence on Range.** FTTS-UV capability of operating on internally carried fuel  
572 for a minimum distance of at least 600 miles (T), 900 miles (O), at GCW across  
573 the OMS/MP as previously stated shall have no impact upon maneuverability or  
574 adaptability on the battlefield.

575

**Rationale.** Maintaining momentum will be a key element to the success or  
576 failure of the FCS/UA force. The FCS FoS must enable the performance of  
577 manpower intensive or high risk functions without exposing soldiers directly to  
578 hazard. The pace and complexity of operations will increase, thereby making  
579 any materiel option which provides maximum protection and maneuverability to  
580 the soldier a desirable advantage to the FCS on the battlefield.

581

#### **Mission Profiles.**

582

Upon entry into the AO, FCS FoS (FTTS-UV) combat units move over  
583 operational maneuver distances (up to 400 km) to designated area(s) of  
584 operation as a coherent, integrated combined arms team with the ability to  
585 conduct their core mission tasks. They will conduct operations with a combat  
586 radius of 75km.

587

**Rationale:** "FTTS-UV Tactical Mobility" is defined as 30 percent improved  
588 roads (paved and gravel) and 70 percent unimproved roads (trails) and cross-  
589 country. Cross-country includes beaches, forests, grasslands, tropical jungles,  
590 mountains, and deserts throughout all seasonal conditions

591

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

<u>Road Surface</u>	<u>Terrain</u>	<u>% Operation</u>	<u>*RMS Range</u>
Improved	Hard Surfaced	10	0.1" - 0.3"
	Gravel	20	0.3" - 1.0"
Unimproved	Trails	30	1.0" - 3.4"
	Cross-country	40	1.5" - 4.8"

592 \* Root Mean Squared (RMS) is a measure of surface and terrain  
593 roughness used to evaluate trafficability.

594 **Rationale:** Operational Mode Summary/Mission Profile

#### 595 **Versatility**

596 FTTS-UV shall adapt an interoperable method to remain compatible with  
597 standard common support equipment for refueling, rearming, resupply, servicing,  
598 and material handling.

599 **Rationale:** Standardize support equipment

600 Each FCS FoS (FTTS-UV) platform must have an internally operated, self-  
601 refueling capability that allows the platform to refuel itself or discharge its  
602 internally stored fuel into another FCS platform or fuel storage receptacle within  
603 30 seconds using automated/robotic means. Additionally, each FCS FoS  
604 platform must be capable of open port, gravity refueling and be compatible with  
605 the FCS refueling system, incorporating a locking fast-refuel capability and the  
606 capability to draw fuel from a fuel cell. FTTS must be interoperable with legacy  
607 and interim refueling systems. If multiple fuel tanks, complete refueling must be  
608 accomplished from a single port.

609 **Rationale:** Rapid, efficient re-supply of the FTTS under all types of conditions  
610 dictates that the system be capable of self-load. Cross-level capability ensures  
611 that FTTS/FCS platforms requiring fuel to complete a mission can receive fuel  
612 from other platforms. Gravity refuel allows FTTS platforms to use commercial or  
613 emergency fuel sources if necessary

614 **Electrical Components.** The FTTS-UV shall have the following electrical  
615 components:

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

616 NATO electrical slave receptacle with electrical capability to jump-start vehicles  
617 with 24 volt systems.

618 **Rationale.** The incorporation of NATO electrical slave receptacles is needed for  
619 starting disabled vehicles on the battlefield.

620 Secure lighting and blackout drive.

621 **Rationale.** Required for operations in night combat environments.

622 Each FTTS-UV shall provide an on-board power recharging capability for each  
623 soldier's associated systems. (Threshold / Objective). Basic electrical outlet (to  
624 include on/off switch) in the crew compartment for 12 volt Direct Current (DC)  
625 and 24 volt DC, supplemental power for plugging in electrically operated devices  
626 (e.g., hand held radio and MWSS battery chargers, computers, flashing warning  
627 lights, mounted water ration heater, etc.).

628 **Rationale.** Vehicle integrated dual power sources are required to permit  
629 rapid installation of ancillary equipment needed for mission accomplishment.

630 Electrical power source outlets 12 and 24 volt outlets in the cargo compartment  
631 with minimum interference with the cargo (110v AC).

632 **Rationale.** Required to facilitate quick hook-up of systems with which the  
633 FTTS-UV will be associated and that require vehicle provided electrical power  
634 delivered to the cargo area.

#### 635 **Vehicle Electric Power Source.**

636 A 28 Volts DC power source of at least a 200 amperes delivered output at  
637 vehicle engine idle speed. A 400 amperes power source kit shall be made  
638 available for systems requiring more than the basic 200 amperes. Systems  
639 requiring more than 400 amperes must provide their own additional power source  
640 (i.e., add-on alternator or generator, or a separate generator). Systems must  
641 maintain compatibility with Joint Team equipment standards and requirements.

642 A 120 Volts AC power source of at least 2500 watts continuous delivered output  
643 at vehicle engine idle speed provided integral to the vehicle to include associated  
644 electrical outlets and power distribution components. Commonality required in  
645 accordance with FCS ORD KPP #1.

646 **Rationale:** This capability is needed to support ancillary systems that perform  
647 functions away from the vehicle and return for recharging. Both strategic  
648 responsiveness and core warfighting abilities must effectively be an integral  
649 component of a joint, interdependent, full spectrum, mission-tailored force by  
650 optimizing combat effectiveness via consumption reduction, alternative  
651 generation, management, and distribution of power and energy across the force  
652 for all systems: motive, electrical, and soldier.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

653 FTTS-UV environmental control units (heating and air conditioning) shall employ  
654 high efficiency systems utilizing power management. Required to support  
655 individual vehicle mission requirements and to augment the power as necessary  
656 to support present and emerging systems requiring electricity. In addition, some  
657 current Signal systems require up to 400 amperes of DC power. By requiring a  
658 400-ampere kit, the integration of power source and truck will be considered at  
659 the beginning of the program. Upgraded power sources are required to produce  
660 sufficient output power for the varied systems located in the various shelters and  
661 present and emerging Combat-Net Radios (CNR) without degrading the vehicle's  
662 operating capabilities. Requiring the 200-ampere DC and 2500-watt AC output  
663 at vehicle engine idle speed extends battery life by maintaining a full charge and  
664 reduces the probability of the engine overheating. Overheating can occur when  
665 operating the engine for long periods of time at high idle, as when on radio watch  
666 for extended periods. . Integrating access to AC power on-board the vehicle  
667 increases capability, deployability, and mobility. Furthermore, low idle output  
668 conserves fuel and reduces vehicle signature. The responsibility to provide  
669 additional power over 400 amperes must rest with the developer of the system  
670 requiring the added power. The FTTS-UV may have to accept an add-on  
671 alternator or some other power generation source to meet this requirement.  
672 Since the requirement for 2500-watt AC is generally limited to mission specific  
673 roles, a kit to provide AC is acceptable.

674 Power storage devices shall be of sufficient power to power the vehicle and  
675 perform electrical requirements in all climatic conditions and shall be  
676 maintenance free.

677 **Rationale.** Mature battery performance characteristics are basic to  
678 electrical system design. The maintenance-free characteristic is needed to  
679 reduce battery care and maintenance required in the field and need to start the  
680 vehicle in all types of weather and power storage must be maintenance free.  
681 This also ensures reduced O&S costs.

682 A system or on-board device which permits starting the vehicle when the vehicle  
683 batteries lack sufficient power to start the engine, exclusive of the slave starting  
684 capability provided by the existing NATO Intervehicle Power Receptacle.

685 **Rationale.** This characteristic is needed on vehicles that are routinely  
686 required to maintain radio watch to enable starting the vehicle when the batteries  
687 are reduced or depleted to the point of being unable to start the vehicle. Once  
688 the battery system has been depleted, the crew cannot use their radio system to  
689 call for assistance. This capability will allow engine restart and improve chances  
690 for mission completion and ensures a get-home capability. A vehicle mounted  
691 kit; easily transported, rechargeable device; or other innovative approaches will  
692 be considered as possible solutions.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

693 The vehicle electrical charging system shall include temperature-compensated  
694 voltage regulation, using temperature sensing within the battery compartment, to  
695 optimize battery charging.

696 **Rationale.** Temperature-compensated voltage regulation will optimize  
697 battery charging, improve battery life in extreme climates, and permit use of  
698 future advanced technology vehicle batteries. The vehicle temperature  
699 performance requirements, the “steady state voltage” design limitations of 25V-  
700 30V DC, and performance input from commercial battery manufacturers will  
701 provide sufficient design guidance to the contractor to accomplish this task.

702 **Idle RPM Control.** An idle RPM control is required to permit increasing and  
703 setting engine idle RPM without using a foot and/or hand throttle to support winch  
704 operations and cold weather start procedures. This high RPM control shall  
705 operate only when the vehicle is in park or neutral and automatically disengage  
706 when the vehicle is placed in gear.

707 **Rationale.** High engine idle is required to allow out-of-cab winch operations  
708 and out-of-cab operation during cold weather warm-up. The cut-off feature when  
709 the vehicle is placed in gear is required to prevent the high idle control from being  
710 used as a cruise control.

711 **Ancillary Electronic Equipment.** The FTTS-UV shall accommodate the  
712 integration of and provide power and space for: i.e. Movement Tracking System  
713 (MTS)/Force XXI Battle Command-Brigade and Below (FBCB2), Driver Vision  
714 Enhancement (DVE) system, GPS, Light Vehicle Obscuration Smoke System  
715 (LVOSS), Maneuver Control System (MCS), NBC M8 Alarm or its replacement,  
716 and Identification Friend/Foe (IFF) systems. All of these systems shall be  
717 operated/used by the crew directly from the cab without interfering with vehicle  
718 operations while vehicle is in motion. Under-the-floorboard conduit shall also be  
719 placed in the vehicle for use in wiring future systems that may be mounted on the  
720 FTTS-UV. Power supplied for these systems is in addition to vehicle-required  
721 power.

722 **Rationale.** The ability to quickly and easily mount/dismount present and  
723 emerging technologies is tied directly to the employment of the FTTS-UV.  
724 Communications/ electronics must be considered in the design of the vehicle to  
725 ensure adequate space and wiring are available and equipment can be crew  
726 operated while the vehicle is in motion. Vehicle structure/body must be strong  
727 enough to accommodate these systems. Future systems may require  
728 connectivity between the back and front passenger seats and to other onboard  
729 systems. Planning ahead for cable routing that will not clutter the interior space  
730 will preclude problems. Once these items have been integrated into the vehicle,  
731 the vehicle must still have enough power to operate and perform its missions.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

732 **Extended Electrical Capability/Capacity.** When applicable, vehicle power  
733 generation and management shall be provided to power weapons systems, Army  
734 Battle Command System (ABCS), and/or support systems and to recharge  
735 MWSS equipment by providing at least 30 kilowatts (kW) (Threshold) (50kW  
736 Objective) of AC for internal and external operational power demands. Cost of  
737 kits, upgrades and distribution systems shall be born by the program for the  
738 associated weapon or support system.

739 **Rationale.** The incorporation of managed AC electric power provisions is  
740 needed to support current and emerging digitization efforts involving Command,  
741 Control, Communications, and Computers (C4); intelligence; weapons; Standard  
742 Integrated Command Post Shelters (SICPS); and maintenance systems. This  
743 capability has the potential to streamline the deployment of Tactical Operation  
744 Centers (TOC) and other high energy demanding systems by reducing or  
745 eliminating the need for towed generator sets through the application of  
746 alternative power generation capabilities (e.g., hybrid energy technology).

747 **Fuel Access Connection.** The FTTS-UV shall have a fuel access connection to  
748 allow access to FTTS-UV fuel for power units.

749 **Rationale.** The fuel access connection is needed to allow the use of FTTS-  
750 UV fuel by power generating units associated with shelters and ambulances.  
751 Commonality is a critical performance characteristic.

752 **Night Vision Device Compatibility.** Lighting, instrumentation, and windshield in  
753 the crew compartment shall be compatible with the latest generation of night  
754 vision devices. Windshield tinting shall not reduce visibility when using night  
755 vision devices. A dimmer switch for instrumentation lighting shall be added for  
756 viewing the instruments with the unaided eye while driving with the AN/PVS-14.

757 **Rationale.** Night vision devices use light intensification and are easily  
758 overloaded and subsequently damaged by excessive light. Providing light in the  
759 proper spectrum and intensity will eliminate this damage. Certain windshield  
760 tinting can reduce visibility when using night vision devices and must be  
761 considered in the design of the vehicle. The FTTS-UV must provide complete  
762 blackout driving as well as the ability for co-driver to see the speedometer and  
763 other instruments when driving with the monocular goggle. Since the  
764 requirement for no aural detection is specified as that achieved by the current  
765 HMMWV, the visual detection at night should be at least as good. This dimmer  
766 switch would allow adjustment of the instrumentation lighting so that it is not  
767 visually detectable with unaided vision at a distance no greater than that of the  
768 current HMMWV.

769 **Mounting Points.** The FTTS-UV shall have mounting points (fore, aft, and  
770 external) and power connections where required, capable of mounting  
771 telephones, computers, antennas, mounted water ration heater, camouflage

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

772 netting (externally), NATO bridge classification placards, flashing warning beacon  
773 kit, and mounting brackets for standard Army fuel/water containers.

774 **Rationale.** The ability to quickly and easily mount/dismount  
775 communications/ electronics and other equipment is tied directly to the  
776 employment of the FTTS-UV and must be considered in the placement of  
777 mounting points on the vehicle to ensure adequate strength, space, and wiring  
778 are available when the equipment is mounted.

779 **Configuration/System Accommodation.** The FTTS-UV shall have mounting  
780 points and reinforced weapon stations to accommodate the following existing  
781 organic systems. Requirements for these configurations can be located in each  
782 organic system's operational requirements document.

783 Contact maintenance truck configurations.

784 Light howitzer prime mover configuration (See M1097 technical specification).

785 Large Area Screening System configuration.

786 TOW missile system configuration.

787 **Rationale.** These systems and configurations are currently transported on  
788 light vehicle assets and will migrate to the FTTS-UV as it becomes available;  
789 therefore, the FTTS-UV design must accommodate them.

790 munition Certification: The FTTS-UV and its companion trailer shall be  
791 certified for ammunition transport.

792 **Rationale:** FTTS-UV will be an ammunition distribution vehicle

793 Power Take Off (PTO): The FTTS-UV shall incorporate PTO on all variants.

794 **Rationale:** To operate all auxiliary equipment.

#### 795 **Potable Water.**

796 Water Generation. The FTTS-Variants shall incorporate an embedded potable  
797 water generation and storage capability that allows the FTTS-Variants and  
798 assigned operator/crew to operate without external water re-supply for a period  
799 of 3 days of high intensity or 7 days of low intensity operations.

800 **Rationale:** The FTTS-Variants embedded water production capability is  
801 ded to enhance flexibility of supply operations, minimize need for special  
802 purpose water units and demands, and increases available combat power

803 Water Dispenser. The FTTS-Variants shall be capable of separately dispensing  
804 cold (ambient temperature) and hot (115-120 Degrees F) potable water from the  
805 bedded potable water generation system in order to provide drinking water  
806 and hydration of compressed rations.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

807 **Rationale:** Compatibility with new field rations requires hot water for re-  
808 hydration enhances soldier quality of life and is in accordance with OSG 40-25,  
809 Nutritional Standards and Education for DoD.

810 Water Cross-Leveling. The FTTS Variants- shall incorporate an internally  
811 operated cross-leveling capability to re-distribute water between other FTTS-  
812 UV/FCS systems and crews. The FTTS-Variants shall be capable of both  
813 dispensing and receiving water during cross-leveling operations and open port  
814 gravity fill.

815 **Rationale:** Cross-leveling is needed to enhance flexibility of supply  
816 operations and increase available combat power. Internal capability minimizes  
817 soldier exposure and enhances soldier protection while reducing the logistics  
818 footprint. Commonality across battlefield is critical.

819 **Captured Water from AC Unit.** All condensation from AC unit shall be captured  
820 and recycled.

821 **Rationale.** All condensation on the AC pipes is potable water and should  
822 be captured to ensure conservation and collection of all available water.

823 **Climatic Conditions.** The FTTS-UV shall be capable of full operation, transport,  
824 and storage in the climatic areas of hot, basic, and cold. A special kit to meet  
825 cold area vehicle and crew operations is acceptable. If a kit is used, it shall be  
826 installed at Field Maintenance level or below. Specifics are listed below:

827 The FTTS-UV shall be able to start and operate in temperatures from -25° to  
828 125° F without special kits, maintaining full mission capability (threshold) and –  
829 25° F to –50° F with special kits while maintaining 90 per cent mission capability  
830 (objective). The vehicle must start and attain operating temperatures in extreme  
831 cold in no more than 30 minutes (threshold).

832 The FTTS-UV and its companion trailer must be capable of being placed in  
833 storage at temperatures ranging between –60° F and 160° F without degradation.

834 **Rationale.** This vehicle is required to operate worldwide in these climatic  
835 conditions. Since cold operations are relatively restricted, kits may be used to  
836 achieve acceptable vehicle and occupant operations below -25 degrees F.

837 **Shelters.** The FTTS-UV shall be capable of carrying the existing S250;  
838 Standard Integrated Command Post Shelter (SICPS) S-787; and Lightweight,  
839 Multipurpose Shelter S-788. Removal and installation shall be accomplished at  
840 organizational level. Emerging and envisioned shelters shall be designed to fit  
841 on FTTS-UV without modification to the platform.

842 **Rationale.** The ability to accommodate these shelters will allow the FTTS-UV  
843 to perform current shelter carrier missions. These shelters are the housing for  
844 the existing High Mobility DGM assemblages (TRC-138C, TRC-173B, TRC-

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

845 174B, TRC-175B, and MD-6950 HMDA Pallet), STAR-T (T3H), and SMART-T  
846 which are currently transported by HMMWV. The ability to remove and install at  
847 organizational level allows for reconfiguring of the system to meet the demands  
848 of the tactical environment.

#### 849 **Recovery and Evacuation Operations.**

850 **Like-Vehicle Towing.** The FTTS-UV at GVW shall be capable of towing any  
851 other FTTS-UV at GVW (Threshold) (GCW – Objective) over the FTTS-UV  
852 mission terrain profile using a standard Army 5-ton wrecker tow bar. Reduced  
853 speed of 15 percent for this operation is acceptable.

854 **Rationale.** To permit evacuation of one FTTS-UV by another FTTS-UV  
855 during periods when standard recovery vehicles are in short supply on the  
856 battlefield. The 5-ton wrecker tow bar is the standard tow bar used for towing all  
857 vehicles 5 tons and lighter. It is recognized that such emergency operation may  
858 require operation at a reduced performance level.

859 **Recovery/Towing.** The FTTS-UV shall be capable of being recovered/lift and  
860 flat towed from both the front (at GCW) and rear (at GVW) by all wrecker  
861 systems, existing and emerging, with no disassembly required.

862 **Rationale.** This requirement is needed to ensure the FTTS-UV can be  
863 recovered and evacuated by Army wheeled wreckers.

864 Each FTTS-UV must retain sufficient mobility in degraded mode to continue the  
865 operation or move to a combat repair location. (Threshold/Objective).

866 **Rationale:** Reduces requirement for recovery assets. A mobility degraded  
867 mode is when a vehicle suffers a mobility injury, such as a damaged wheel from  
868 a land mine, and driven on five of six or seven of eight wheels at a reduced  
869 speed to a sustainment area to be repaired.

870 **Tow Eyes.** Tow eyes on the FTTS-UV must be of sufficient strength to withstand  
871 the maximum forces encountered while being used for towing and winch  
872 recovery operations described in this document.

873 **Rationale.** Towing eyes will be used for both towing and winch recovery  
874 operations; therefore, they must be of sufficient strength to be suitable for these  
875 operations. These shall preclude damage to vehicle components such as axles,  
876 CV joints, bumpers, etc. as well as prevent harm to the operator.

877 The FTTS UV and its companion trailer shall incorporate means to adjust tire  
878 pressure to increase cross country mobility. The FTTS-UV shall incorporate  
879 this capability to allow the operator to adjust tire pressure

880 ○ From GVW to GCWR

881 ○ by axle

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

882                   ○ For terrain conditions

883   The FTTS-UV and its companion trailer shall have the capability to inflate/deflate  
884   while moving tire pressure from the hard surface pressure to sand pressure in 5  
885   min.

886         **Rationale:** Improved mobility will be needed over a variety of terrains and in  
887   a variety of conditions. The FTTS-UV must have near instantaneous capability to  
888   transition from hard surface to soft surface/austere conditions.

889   **Cargo Tie-Down Provisions.** The FTTS-UV shall have cargo tie-down  
890   provisions in the cargo area that meet military standard requirements and shall  
891   be certified to transport ammunition.

892         **Rationale.** For safety of personnel and cargo inside the vehicle, equipment  
893   must be capable of being secured (tied down or strapped) to prevent movement  
894   or shifting during vehicle operation.

#### 895   **Lethality**

#### 896   **Tactical Security.**

897   **Noise Suppression.** The FTTS-UV noise signature shall be no louder than the  
898   quietest HMMWV or no greater than the FCS -- whichever is quietest. A kit may  
899   be used to provide this capability. If a kit is used, it shall be installed at Field  
900   Maintenance level or below, and shall not be counted against payload.

901         **Rationale.** The vehicle must be able to operate in or near the enemy's  
902   operational area. Noise generated from the FTTS-UV will give away friendly  
903   force's location and decrease survivability of personnel and vehicles. The FCS  
904   noise level, if quieter than the HMMWV, must be achieved in order to retain  
905   tactical security of the organization when operating in the same area as the FCS.  
906   A kit may provide this capability, but must not impact upon the payload carried to  
907   preclude the commander having to choose between noise suppression and  
908   critical mission equipment.

909   **Engine-Off Driving Capability.** Selected FTTS-UV versions, without the power  
910   unit operating, shall:

911   Be capable of driving 5 miles cross-country and performing silent watch.

912   Be capable of driving 20 miles at 35 MPH on a dry, level, hard-surface road.

913         **Rationale.** Engine-off driving for short periods of time will enhance  
914   tactical survivability and increase fuel economy of the system when both are  
915   paramount.

916   **Silent Watch Capability.** Selected FTTS-UV versions, without the power unit  
917   operating, shall have the capability of sustaining 6 kW hours (Threshold) (9 kW  
918   hrs – Objective), of continuous electrical power usage over a 12-hour period.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

919           **Rationale.** Silent Watch is defined as engine off static vehicle operations  
920 where communicating by radio, observing with powered optical systems, and  
921 laser range finding takes place. These functions are critical while in combat  
922 areas and the noise associated with and fuel consumed by engine starting and  
923 running to recharge batteries has always been a shortfall in maintaining tactical  
924 security.

#### 925 **Self-Defense Weapons.**

926 **Primary.** The FTTS-UV shall have provisions for mounting self-defense  
927 weapons (e.g., M2, M240, M249, M60 Machine Gun, or MK-19 Grenade Machine  
928 Gun) with ammunition can (if required) on top of the vehicle. The mounting  
929 device shall permit operation of the weapon while traversing 360 degrees  
930 horizontally with little effort from the gunner and without interfering with other  
931 crew operations. Provision to enable the 5<sup>th</sup> to 95<sup>th</sup> percentile target audience  
932 soldier to operate the weapon (without interfering with other crew operations) is  
933 required. A mechanical traverse with a positive travel lock capability is required.  
934 The gunner shall be able to perform all crew service functions on the weapon  
935 while it is mounted in operating position. Spent brass and links shall not enter  
936 the crew compartment. The gunner shall be able to engage targets from within  
937 the crew compartment, as well as by a gunner positioned in a ring mount, if  
938 provided. (Characteristics for this capability are found in the approved Common  
939 Remotely Operated Weapon System (CROWS) ORD, dated 22 Apr 99.) If a full  
940 overhead crew compartment protection kit is installed, it is required that the  
941 weapon system be compatible with the platform. **(Currently writing provisions**  
942 **for a dual weapons mount.)**

943           **Rationale.** Automatic weapons are essential for vehicle/crew defense  
944 against ground and air attacks and especially in urban environments during  
945 stability and support operations in which the vehicles may be forced to operate  
946 independently. The ability to traverse 360 degrees horizontally gives the gunner  
947 the mobility to acquire and engage targets from all directions. The weapon must  
948 be accessible to accommodate the variety of personnel that will operate the  
949 weapon. A mechanical traversing mechanism is needed to assist the operator to  
950 traverse his weapon when firing from the vehicle while it is on an incline. The  
951 positive travel lock is needed to prevent the weapon from freely rotating while  
952 underway. The requirement for the gunner to be able to perform all normal  
953 weapon functions with the weapon mounted is needed to ensure that there is  
954 sufficient space to perform such functions as weapons clearing and misfire  
955 corrective actions. Keeping spent brass and links out of the crew compartment is  
956 needed to prevent possible injury to the crew and to ensure there is no  
957 interference with vehicle operations. The ability to operate these weapons from  
958 within the vehicle eliminates the need for the gunner to expose himself to fire.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

959 **Secondary.** There shall be provisions for mounting a second (rear-firing) self-  
960 defense weapon station (i.e., M2, M240, M249, M60 Machine Gun, or MK-19  
961 Grenade Machine Gun) with ammunition can (if required) to provide defense to  
962 the rear 180 degrees of vehicle, in addition to the primary weapon station. The  
963 mount shall have provision to be capable of traversing with little effort from the  
964 gunner and without interfering with crew operation. Provision to enable the 5<sup>th</sup> to  
965 95<sup>th</sup> percentile target audience soldier to operate the weapon (without interfering  
966 with other crew operations) is required. The crew must be able to perform all  
967 crew service functions on the weapon while it is mounted at the rear facing  
968 ion. Spent brass and links shall not enter the crew compartment.

969 **Rationale.** Automatic weapons are essential for vehicle/crew defense  
970 against ground and air attacks and especially in urban environments during  
971 stability and support operations in which the vehicles may be forced to operate  
972 independently. Due to the limited forward firing arc of the TOW missile system,  
973 the secondary gun position is needed to provide protection, early warning, and  
974 defense from rear approaching threats. The desired secondary weapons station  
975 for other FTTS-UVs also provides protection, early warning, and defense to the  
976 rear, which is normally an area not under constant observation. This secondary  
977 weapon dramatically improves crew, convoy and unit protection, particularly in  
978 close terrain. The weapon must be accessible to accommodate the variety of  
979 personnel that will operate the weapon. The requirement for the crew to be able  
980 to perform all normal weapon functions with the weapon mounted is needed to  
981 ensure that there is sufficient space to perform such functions as weapons  
982 clearing and misfire corrective actions. Keeping spent brass and links out of the  
983 crew compartment is needed to prevent possible injury to the crew and to ensure  
984 there is no interference with vehicle operations.

985 **Gun Shield Kit.** A gun shield kit shall be provided for use with the primary  
986 weapon station and shall be able to defend against multiple hits from 7.62mm  
987 B32 Armor Piercing (AP) rounds or their equivalent. Protection shall be from  
988 rounds fired at 100 meters standoff range with no perforation when fired at 0-  
989 degrees obliquity horizontally over 0-360 degrees attack directions to the vehicle  
990 and to the roof area at 60-degrees obliquity. Use of the current gun shield is  
991 acceptable. The gun shield shall be removable at the organizational level without  
992 special tools.

993 **Rationale.** The gun shield significantly enhances survivability for the  
994 weapons operator as he engages targets. The existing HMMWV gun shield  
995 provides a level of protection sufficient to meet mission requirements. Removal  
996 at organizational level will allow for quick reconfiguration of the system in a  
997 combat environment.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

998 **Ammunition Storage.** Provisions shall be made for self-defense weapon  
999 ammunition storage that meet U.S. Army Defense Ammunition Center and  
1000 School (USADACS) security certification requirements to transport ammunition  
1001 over the vehicle mission profile. Storage provisions shall have a readily  
1002 accessible quick release. Space allocations shall be provided for at least the  
1003 following type and quantity of standard Army ammunition:

Ammunition Type	Quantity
M16	2 cans
M203	1 can
Mk-19, M2 or M60/M240	6 cans
M249	4 cans

1004 **Rationale.** All ammunition transported on U.S. highways requires certified  
1005 secured stowage to prevent spillage and damage in transit. The quick release is  
1006 needed to permit quick access to the ammunition in the event of an attack. The  
1007 quantities of ammunition indicated are required to support the Military Police  
1008 mission.

1009 **Survivability.**

1010 **User Interface.** The safety, efficiency, and effectiveness of the interface  
1011 between the FTTS-UV and those who must operate, support, or maintain it are  
1012 critical to the acceptance and utilitarian value of the system.

1013 **Rationale.** System efficacy can be no greater than the efficiency and  
1014 effectiveness of the user (operator, maintainer, support personnel) interface.  
1015 This is particularly and increasingly true in an environment of rapidly changing  
1016 and more complex technology wherein, aside from budget; human safety and  
1017 performance considerations are "active" constraints to implementing and fully  
1018 benefiting from engineering advances. Ensuring a "user friendly" interface  
1019 enhances the viability of the FTTS-UV and support its ability to satisfy intended  
1020 mission and maximize potential. Increased commonality eliminated training time  
1021 and need for users to become familiar with new systems.

1022 **Automatic Transmission.** If the FTTS-UV has a traditional transmission, it shall  
1023 be automatic.

1024 **Rationale.** Provides standardization and simplifies driver training while  
1025 decreasing maintenance requirements. Automatic transmissions improve  
1026 operator control during severe off-road operations.

1027 **Camouflage.** The FTTS-UV shall be painted in NATO three-color camouflage or  
1028 desert tan using Chemical Agent Resistant Coating (CARC) or a DA G4

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1029 approved substitute (Threshold). The FTTS-UV shall employ signature reduction  
1030 techniques and materials in order to reduce its detection by visible, infrared,  
1031 near-infrared, radar, laser, and acoustic devices (Objective).

1032 **Rationale.** Three-color is the standard Army equipment camouflage paint  
1033 scheme found to possess the ultimate hide capability in tactical operations. Use  
1034 of CARC or other approved substitute is needed to comply with the NBC  
1035 requirement in this document. Meeting the Objective will decrease detection thus  
1036 increasing the survivability of the system in a combat environment.

1037 **Nuclear, Biological, and Chemical (NBC).** The FTTS-UV shall be capable of  
1038 operating in NBC environments and have NBC contamination/decontamination  
1039 survivability through the use of a contained vehicle systems, thereby eliminating  
1040 the opportunity to have contact with outside contagions.

1041 **Rationale.** In an NBC environment, decontamination is a necessity for  
1042 continued operations. Therefore, equipment design must consider compatibility  
1043 with potential contaminating agents and decontamination processes. Surviving  
1044 contamination and decontamination is necessary to ensure the FTTS-UV is still  
1045 operationally acceptable after operating through an NBC contamination situation.

1046 **Chemical.** Each FTTS-UV must possess a capability to detect chemical hazards  
1047 (Threshold) prior to incapacitating dose time. This warning will automatically  
1048 populate the COP.

1049 **Rationale.** This capability provides maximum protection at the individual  
1050 Soldier level, both on a platform and on the ground. Provides continuous  
1051 operations capability eliminating the need for operational pauses. Supports a  
1052 common situational understanding of the battlespace.

1053 **Chemical Agent Resistant Coating (CARC).** FTTS-UV must be hardened  
1054 against agent absorption to preclude damage to the FTTS-UV during  
1055 decontamination operations. Hardening must be such that decontamination will  
1056 cause no loss of platform functions that cannot be restored at organizational-level  
1057 maintenance or with a replacement (Threshold)/no loss of platform functions  
1058 (Objective). Also, the CARC will be able to be touched up without special  
1059 equipment and monitoring requirements (Objective).

1060 **Rationale:** CANE study shows that system effectiveness, unit operational  
1061 performance, and command and control will be degraded if the CB hazard is not  
1062 reduced.

1063 The FTTS-UV shall have a CBRN capability to sustain the crew without the use  
1064 of individual protective over-garments and masks while operating in a CBRN  
1065 environment for 6 hours (Threshold)/12 hours (Objective). The manned systems  
1066 capability must allow for exiting the vehicle from one hatch without compromising  
1067 crew safety to loss of protection.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1068       **Rationale:** Enhances soldier endurance and stamina to fight effectively under  
1069 all operational and environmental conditions. Provides continuous operations  
1070 capability minimizing the need for tactical pauses until the situation allows hasty  
1071 or deliberate decontamination, or preparation for increased individual MOPP  
1072 status. CEP Chem Bio excursions conducted in support of MANCEN Rock Drill  
1073 13-15 Aug 02 demonstrated extensive reduction in soldier performance and  
1074 survivability in systems without overpressure.

1075       **Nuclear Survivability.** The critical functions of the FTTS-UV shall survive the  
1076 initial effects from nuclear weapons where at least one crewmember remains  
1077 combat effective. The critical functions of the FTTS-UV shall be High-Altitude  
1078 Electromagnetic Pulse (HEMP) survivable. The FTTS-UV does not have to  
1079 operate through the HEMP event. Recycling power to restore operations after a  
1080 HEMP event is acceptable. The critical functions of the FTTS-UV are driving and  
1081 providing power to the payload, to include vehicle subassemblies and component  
1082 parts needed to accomplish these tasks.

1083       **Rationale.** HEMP survivability is required to ensure continuation of the  
1084 vehicle mission and to return crew to reconstitution site subsequent to a nuclear  
1085 detonation that is otherwise survivable. The inclusion of related vehicle  
1086 subassemblies and component parts is required to ensure that replacement parts  
1087 and future upgrades to vehicle components do not degrade or negate the  
1088 performance of the approved FTTS-UV configuration(s). In cases where the  
1089 FTTS-UV is a critical component of another system, it must survive initial nuclear  
1090 weapon effects to the level directed by those systems.

1091       **Electromagnetic Interference (EMI).** The FTTS-UV shall comply with  
1092 applicable military EMI and electromagnetic emission susceptibility requirements,  
1093 and commercial electromagnetic compatibility standards/recommendations as  
1094 needed to support electronic engine, transmission, braking, CTIS controls, and  
1095 other vehicle electronic components/controls.

1096       **Rationale.** The application of electronic controls to major system (Non-  
1097 Developmental Item (NDI)/Commercial) components has necessitated additional  
1098 design and performance controls to ensure mutual compatibility.

1099       **Flashing Warning Beacon Kit.** A 360-degree flashing warning beacon kit shall  
1100 be made available for mounting on the FTTS-UV.

1101       **Rationale.** The requirement for a 360-degree flashing warning beacon kit is  
1102 needed to ensure an adequate warning device is available when needed for lead  
1103 and trail vehicles for such tasks as convoy and wide load warning vehicles. A  
1104 flashing-type warning beacon is a significant improvement over older style  
1105 rotating warning beacons because of less moving parts and a higher reliability  
1106 under field conditions.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1107 FTTS must provide combat identification (CID) of friend or unknown in a Joint,  
1108 Allied/Coalition environment through platform-to-platform (manned and  
1109 unmanned, ground and air), platform-to-soldier, soldier-to-platform and soldier-to-  
1110 soldier under all battlefield and weather conditions across the spectrum of  
1111 operations. CID systems must interface with the C4ISR communications network  
1112 for development and maintenance of the COP. All CID must be joint  
1113 interoperable / understood.

1114 **Rationale:** The ability of an FTTS CID system to positively identify friendly  
1115 platforms equipped with compatible/interoperable CID technologies is necessary  
1116 to prevent fratricide. TBD

1117 **Crew Compartment Protection Kit.** The FTTS-UV shall have a kit made up of  
1118 two parts, an Underbody Protection Kit and a Ballistic Protection Kit. The  
1119 combined kit shall provide protection to soldiers in the crew compartment,  
1120 defined as the primary and secondary seating area. The kit design shall  
1121 minimize mission degradation of the vehicle to which it is attached. The  
1122 protection kit shall be designed with several components that can be installed  
1123 independently of each other.

1124 **Rationale.** The crew compartment protection kit is included as part of the  
1125 vehicle requirement so the vehicle and kit will be designed together to ensure  
1126 complete compatibility when installed in the field. This protection kit requirement  
1127 is in consonance with the approved Crew Protection Kit (CPK) ORD for  
1128 previously fielded wheeled vehicles. Independently installed components allow  
1129 the commander to tailor protection based protection needed to meet the  
1130 perceived threat.

1131 **Underbody Protection Kit (UPK).** The crew compartment protection kit shall  
1132 include a UPK with the following capabilities. The UPK shall protect the crew  
1133 compartment occupants from the blast, fragments, and injurious acceleration  
1134 (both vertical, to include the impact of the vehicle returning to the ground, and  
1135 horizontal) effects of antipersonnel fragmentation mines (to include unexploded  
1136 artillery sub-munitions -- minimum 500 grams/1 pound explosive weight -- and  
1137 Claymore type mines) and blast type antitank mines and other blast munitions  
1138 such as grenades, bomblets, and mortar rounds used as mines (up to the  
1139 equivalent of 12 pounds (Threshold) (16 pounds – Objective) of TNT explosive  
1140 weights), pressure detonated under the wheel station, with no fragmentation  
1141 perforation and no significant crew compartment deformation or permanent  
1142 debilitating injury to crew compartment occupants. Seats may be designed to  
1143 attenuate some of the force from the mine blast. Protection provided by the  
1144 design of the seat shall not degrade soldier comfort or ease of operation.

1145 **Rationale.** This requirement is in consonance with the approved CPK ORD  
1146 and the predecessor Up-Armored HMMWV Addendum to the HMMWV JMENS

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1147 document and establishes protection levels that enhance soldier survivability  
1148 against mines and explosives in combat and peacekeeping environments.

1149 **Ballistic Protection Kit (BPK).** The crew compartment protection kit shall  
1150 include a BPK with the following capabilities:

1151 **Small-Arms Protection.** The BPK shall provide the crew compartment  
1152 occupants protection from multiple hits from 7.62mm B32 Armor Piercing (AP)  
1153 rounds or their equivalent. Protection shall be from rounds fired at 100 meters  
1154 standoff range with no perforation when fired at 0-degrees obliquity horizontally  
1155 over 0-360 degrees attack directions to the vehicle and to the roof area at 60-  
1156 degrees obliquity. The spacing between projectile impacts shall be set in  
1157 accordance with appropriate military standards for the given material. Seat  
1158 structure may be used to provide some of the 360-degree horizontal protection.  
1159 Protection provided by the design of the seat shall not degrade soldier comfort or  
1160 ease of operation.

1161 **Area Weapon Protection.** The BPK shall provide protection to the crew  
1162 compartment occupants against artillery fragments (United States 155mm) with  
1163 no perforation for each detonation at a 60 meters (20 meters desired) standoff  
1164 range for any degree elevation or azimuth to the vehicle. For vehicles with  
1165 weapons mount, this requirement is with closed hatch.

1166 **Rationale.** This requirement is in consonance with the approved CPK ORD  
1167 and the predecessor Up-Armored HMMWV and establishes protection levels  
1168 which enhance soldier survivability against small arms ammunition and  
1169 mortar/artillery fire anticipated in combat and peace keeping environments.

1170 **Mounting.** Mounting provision shall be installed on all vehicles that allow for  
1171 independent installation of the components of the UPK and BPK as well as the  
1172 combination of the two. No welding shall be required to mount kit components  
1173 on factory installed mounting provisions. Either mounting or demounting of the  
1174 complete system shall be accomplished within 2 clock hours (Threshold) (30  
1175 minutes - Objective) using two maintainers and tools found at Field Maintenance  
1176 level.

1177 **Rationale.** Installation at Field Maintenance level is dictated by operational  
1178 deployment readiness and allows for removal in CONUS during training and  
1179 administrative operations. The requirement for no welding allows for installation  
1180 and removal without permanent modification to the vehicle. The truck is  
1181 effectively out of service during the mounting/demounting process; therefore  
1182 attainment of the Objective will increase the availability of the truck. (This is also  
1183 based upon emerging requirements of the FCS UA.)

1184 **Crew Compartment Protection Kit Maintenance Impact.**

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1185 The crew compartment protection kit design shall not interfere with maintenance  
1186 of the vehicle to which attached. Easy access to frequent vehicle maintenance  
1187 areas shall be inherent in the kit design. When parts of the protection kit must be  
1188 removed for maintenance, they shall be easily and quickly removed and  
1189 reinstalled so as not to increase the maintenance ratio beyond the requirement.

1190 **Rationale.** Design of the kit with vehicle maintenance in mind will minimize  
1191 the increased maintenance burden placed on the unit when in use.

1192 The crew compartment protection kit shall require no maintenance beyond  
1193 standard Preventive Maintenance Checks and Services (PMCS) performed by  
1194 the operator using onboard BII tools. Easily replaceable parts shall permit unit  
1195 level replacement of portions of the kit without special tools or unique skills.

1196 **Rationale.** To reduce to a minimum the maintenance burden imposed on  
1197 the unit and operator by installation of the protection kit or its components.

1198 **Crew Compartment Protection Kit Storage.** The crew compartment protection  
1199 kit shall be designed for storage for extended periods of time without adverse  
1200 effects from weather (to include ice and blowing snow and sand), humidity,  
1201 temperature, or sunlight in hot, basic, and cold climates.

1202 **Rationale.** It is envisioned that this kit may be kept in long term outside  
1203 storage in various parts of the world while awaiting use. The kit will not likely be  
1204 installed in peacetime, except for brief training periods. Available storage space  
1205 in some unit locations may be limited. Therefore, the kit may not always be  
1206 stored under the most ideal conditions. It must be fully capable of maximum  
1207 crew protection upon installation after extended periods of storage under adverse  
1208 conditions.

#### 1209 **Winch Kit.**

1210 A winch kit (electric desired) with cable, chain, shackle, and snatch block shall be  
1211 provided. The winch kit shall have the following characteristics:

1212 **Rationale.** A vehicle operating in remote areas off road can easily become  
1213 mired while negotiating unfamiliar terrain. Based on Mission, Enemy, Terrain,  
1214 Troops, and Time Available (METT-T), a recovery vehicle (wheeled wrecker)  
1215 may not be available within a reasonable length of time. Depending on the  
1216 situation, such delay could be extremely hazardous to the occupants. Providing  
1217 an "operator friendly" winch kit will allow the FTTS-UV operator to expediently  
1218 extract the vehicle from a mire situation and complete the mission. The desired  
1219 electric powered winch more efficiently uses the power available on the FTTS-  
1220 UV.

1221 The winch shall be capable of operations to both the front and rear of the vehicle.  
1222 The time to change winch directions shall not exceed 60 minutes (Threshold) (30

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1223 minutes - Objective) by two soldiers (Threshold) (one soldier - Objective) using  
1224 FTTS-UV BII tools.

1225 **Rationale.** Time constraints and requirement to use FTTS-UV BII tools  
1226 allows crew flexibility to self-recover from a wide range of situations without  
1227 impacting on the overall mission. A vehicle unable to be recovered in a timely  
1228 manner may have to be abandoned / destroyed. This requirement envisions a  
1229 maximum of 1.5 hours elapsed time for the total recovery cycle from the time the  
1230 vehicle gets stuck until it is again underway. The 30 minutes Objective time to  
1231 change winch directions will provide a factor of safety in the total recovery time  
1232 and ensure a greater number of successful recovery operations. It is the  
1233 Objective that only one soldier be required to accomplish all winch tasks, since  
1234 this vehicle may frequently be operated by one soldier.

1235 The winch shall be capable of being removed and installed on another vehicle by  
1236 two soldiers, using BII, in 60 minutes (Threshold) (30 minutes - Objective) or  
1237 less.

1238 **Rationale.** Time constraints and requirement to use FTTS-UV BII tools  
1239 allows commanders and crew personnel the flexibility to reconfigure vehicle  
1240 assets in a timely manner while in the field. The Objective reduces the  
1241 turnaround time to put a vehicle in the field with winch capability thus reducing  
1242 the risk of having to abandon a vehicle in the field.

1243 The winch, cable, and BII winch accessories shall be able to withstand and  
1244 overcome loads equal to two times the GVW of the FTTS-UV.

1245 **Rationale.** To provide sufficient strength to extract a vehicle in a fender  
1246 depth mire (i.e., mired to the top of the wheels) as recommended by the Army  
1247 Executive Agent for Vehicle Recovery.

1248 The winch cable must be long enough to reach an anchor 45 feet (Threshold) (75  
1249 feet Objective) from the FTTS-UV and return (using the snatch block) to enable  
1250 self-recovery with a 2:1 mechanical advantage.

1251 **Rationale.** To ensure sufficient cable to safely recover from most  
1252 situations.

1253 The winch shall incorporate an automatic brake that stops the cable from paying  
1254 out when not under power.

1255 **Rationale.** The automatic brake is needed to prevent inadvertent payout of  
1256 the cable when the power is off and the cable is under load.

1257 The winch shall have a free spooling capability.

1258 **Rationale.** A free spooling capability is needed to enhance hook-up  
1259 operations by allowing the cable to pay out without having to use winch power.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1260 The FTTS-UV shall have mounting points/power supply provisions for mounting  
1261 the winch kit and provide control for inside-/outside-vehicle operations.

1262 **Rationale.** Provisions for a demountable winch are needed for ease in  
1263 moving from one vehicle to another (in the case of vehicles in maintenance or  
1264 unserviceable turn-ins). Capability of inside-/outside-vehicle operation permits  
1265 operator the flexibility of using vehicle traction in self-recovery or using the  
1266 stationary vehicle to assist in recovery of another vehicle.

1267 **Gunner Restraint System.** Those FTTS-UV versions having a self-defense  
1268 weapon shall have a gunner restraint system, which allows 360 degree, weapon  
1269 operations while preventing ejection of the gunner in case of an accident. This  
1270 system shall not hinder quick reentry into the vehicle.

1271 **Rationale.** The restraint system is required to minimize catastrophic injury  
1272 resulting from an accident and to prevent the gunner from being inadvertently  
1273 ejected during rough off-road operations.

#### 1274 **Sustainability**

##### 1275 General

1276 The FTTS MSV must organically sustain itself for three days of high tempo  
1277 operations without replenishment from external sources in continuous combat in  
1278 mid-to-high intensity conflict and be self-sustainable for up to seven days in low-  
1279 end conflict and peacetime military engagement. The UA must be self  
1280 sustainable for the specified time/OPTEMPO for Classes I, III, V, VIII, IX, and  
1281 water.

1282 **Rationale:** The Army will aggressively reduce its logistics footprint and  
1283 replenishment demand. This means that the OF will deploy fewer vehicles and  
1284 leverage combat service support reach capabilities that allow commanders to  
1285 reduce stockpiles in theater while relying on technology to provide sustained  
1286 velocity management and real time tracking of supplies and equipment.

1287 Fuel Efficiency (Key Performance Parameter (KPP)). As a measure of fuel  
1288 efficiency, fuel consumption and storage shall not be greater than current  
1289 predecessor systems over the mission profile representative terrain while  
1290 maintaining an effective operational range of 900 miles (Threshold) 1500 miles  
1291 (Objective) before refueling.

1292 **Rationale:** To achieve reduction in logistics footprint, sustainment forces  
1293 must reduce fuel consumption and support forces over extended distances  
1294 without pause. The threshold is representative of the doctrinal distances that the  
1295 UA will deploy and the FSB must retain the capability to return to a sustainment  
1296 site to resupply/pick up more supplies.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1297 Corrosion Resistance. Corrosion resistance shall be sufficient to ensure  
1298 serviceability for the entire expected 22 year EUL of the vehicle without rebuild.

1299 **Rationale:** The FTTS will operate and be stored in areas with high slat  
1300 content, and as such must be operable for extended periods in those.

1301 The FTTS and its companion trailer will enable significant sustainment  
1302 effectiveness and efficiencies through commonality in platforms and components  
1303 to simplify and reduce logistics, support multi-functionality, reduce personnel and  
1304 skills required, and contribute to simplification of deployment. The emphasis will  
1305 be on the FTTS platform/module in addition to lateral commonality with FCS and  
1306 will not concentrate on backward compatibility except as specifically addressed in  
1307 the ORD. In summation, FTTS-UV shall have the capability to quickly cross level  
1308 supplies between platforms (FTTS to FTTS and FTTS to FCS) inside the UA.

1309 **Rationale:** Commonality across formations, in platforms and components is  
1310 required to simplify and reduce sustainment requirements, support multi-  
1311 functional soldiers, reduce the many personnel and skills required in today's  
1312 organizations, and contribute to simplification of deployment, maintenance and  
1313 training, and to reduce equipment and other resource requirements. Rapid cross  
1314 leveling capability helps reduce the number of re-supply vehicles needed to  
1315 sustain the force. This capability also improves crew survivability by minimizing  
1316 their exposure to enemy observation and fire during re-supply operations.

1317

1318 For notification of out-of-cycle re-supply, cross-leveling and to reduce  
1319 sustainment requirements FTTS-UV shall incorporate an embedded mission  
1320 readiness system. This system will monitor the status of mission-critical  
1321 components/subsystems (including the crew) and all consumables. These  
1322 sensors will collect and transmit to a data collection point the amount of fuel on-  
1323 board, rounds remaining, potable water on-board, and rations on-board. If a  
1324 condition is detected that degrades mission capability, the embedded system will  
1325 determine what action (repair, resupply, crew rest period, etc.) is required to  
1326 restore full mission capability. The embedded mission readiness system will  
1327 interface with the crew operating station and the C4ISR system to provide  
1328 required status reports and alerts IAW reporting criteria set by the operational  
1329 commander. The embedded readiness system will include the capability to  
1330 forecast the future state of the FTTS system on which it is located. It will forecast  
1331 equipment degradation/failure using prognostics algorithms and data from  
1332 embedded sensors and operating maintenance logs. It will maintain compatibility  
1333 with all systems at higher and with all (objective) / the majority (threshold) of the  
1334 FCS systems for

1335 **Rationale:** Permits sustainment of forces with supplies they need, when they  
1336 need them. Also facilitates cross leveling of supplies when required.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1337 Commanders at all levels must be provided simply displayed but comprehensive  
1338 pictures of their sustainment status. This information must be tailorable to  
1339 display all or a portion of the COP as relevant to the various echelons and  
1340 functions. Threshold information may use current sustainment categories as  
1341 metrics, collating data passed up from platform level. This requirement is key to  
1342 the reduction of mechanics and the logistics footprint of the UA as well as  
1343 enabling the pulse logistics concept. Embedded diagnostics and prognostics on  
1344 platforms will reduce demand and minimize the maneuver sustainment burden  
1345 on unit effectiveness. Enables mission staging to rapidly execute sustainment  
1346 transitions with reduced logistics footprint.

#### 1347 Maintenance

1348 Maintenance Ratio (MR) will not exceed 0.025 Maintenance Man-  
1349 Hours/Operating Hour (MMH/OH).

1350 **Rationale:** The Army will aggressively reduce its logistics footprint and  
1351 replenishment demand. The Objective Force will deploy fewer vehicles and  
1352 leverage reach capabilities. Also, the sustainment system will reduce  
1353 unnecessary nodes, both physical and decision-making. A “right-sized”  
1354 sustainment footprint will emerge. Maintenance operations within the OF will be  
1355 conducted using a vastly different approach from today's legacy structure.  
1356 Today's structure requires several echelons of maintenance supporting a  
1357 brigade. The FTTS must be supportable by a two level maintenance system  
1358 ("Field" and "Sustainment" maintenance). Field maintenance will consist of  
1359 repair-and-return-to-user on-system tasks, those tasks that do not require  
1360 disassembly of a component (primarily LRU/LRM replacement), and will be  
1361 performed forward in the battle space. Sustainment maintenance will consist of  
1362 repair-and-return-to-supply off-system tasks, those tasks required to return  
1363 components, subassemblies, and/or end item systems to a serviceable condition.  
1364 Sustainment maintenance will be performed by military, government civilians,  
1365 and/or contractors, and will take place at designated locations in the Unit of  
1366 Employment (UE) Units or potentially as far back as CONUS. The OF has been  
1367 designed with a significantly smaller footprint in maintenance personnel, and so  
1368 will require systems that are designed with significant increases in reliability and  
1369 allow maximum crew/operator repair and maintenance. Plug and play component  
1370 design of systems and subsystems, coupled with embedded diagnostic and  
1371 prognostic tools, will greatly enhance the capability of the crews to perform a  
1372 larger number of maintenance associated tasks. Heavy reliance on operator/crew  
1373 maintenance is essential to the OF concept of maintenance support and a key  
1374 factor in the overall reduction of the sustainment footprint. The operator of each  
1375 FTTS platform/module will be responsible for at least 60% of all field  
1376 maintenance requirements and limited battlefield damage assessment and repair  
1377 (BDAR). Each UA will have a small number of 2-3 man combat repair teams

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1378 (CRTs) within their organic Forward Support Battalion (FSB) to perform field  
1379 maintenance requirements beyond the capability of the operator, more in depth  
1380 BDAR, and limited recovery operations. The immediate maintenance support  
1381 focus within the UA will be those limited maintenance functions required to keep  
1382 systems operational until completion of the current operation pulse (72 hours to 7  
1383 days). FTTS platforms/modules deemed unsuitable for repair on site (METT-T  
1384 dependent) will be recovered to a safer location for those repairs necessary to  
1385 allow the platform to return to action and complete its current mission. Primary  
1386 method of recovery will be self or like vehicle recovery, augmented by the CRT or  
1387 UE (Equivalent) utilizing a FRMV/FTTS-MRV as required. Systems requiring  
1388 extensive repair time, catastrophic failure, or extensive battle damage will be  
1389 evacuated to effect further repairs and may be replaced with "ready-to-fight"  
1390 replacements, if available. The FTTS will enable significant sustainment  
1391 effectiveness and efficiencies through commonality in platforms and components  
1392 to simplify and reduce sustainment, support multi-functionality, reduce personnel  
1393 and skills required, and contribute to simplification of deployment.

1394 Preventive Maintenance. FTTS platforms/modules must be designed so that  
1395 scheduled preventive maintenance services must not be conducted more  
1396 frequently than annually without adversely impacting the stated system reliability  
1397 requirements.

1398 **Rationale:** Reducing the required frequency of scheduled preventive  
1399 maintenance services will increase commander flexibility while deployed and  
1400 reduce the logistics footprint, time, and costs associated with maintenance at  
1401 home station.

1402 Oil and Lubricants. Single fluid shall be used for all lubrication and hydraulic  
1403 applications. All fluid analysis, if required, shall be performed on system with the  
1404 result provided to the interface of the maintenance system.

1405 **Rationale:** The need for a single fluid for lubrication and hydraulic  
1406 applications is dictated by the requirement to reduce numbers of types of fluid on  
1407 the battlefield. This consolidation of fluids will have a significant impact on the  
1408 logistics support requirements of the OF. An on-system analysis capability is  
1409 needed to ensure real-time information on the status of the lubricant system is  
1410 available to the UA maintenance system. This will reduce or prevent damage of  
1411 the vehicle as a result of lubricant contamination or degradation.

1412 If the FTTS-UV design incorporates a fuel burning engine, it shall operate on JP8  
1413 and any standard Diesel fuels dispensed using standard Army refueling systems  
1414 for wheeled vehicles. Additionally, the FTTS-UV shall be capable of operating on  
1415 fuels used by the FCS.

1416 **Rationale:** JP8 has been identified as the Department of Defense (DOD)  
1417 standard fuel. The use of any standard Diesel fuel as well as those fuels used by

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1418 the FCS will ensure the FTTS-UV will have the capability to remain operational in  
1419 areas where fuel supplies are limited to what is available on hand.

1420 Fuel Sustainment. Each FCS FoS (FTTS-UV) platform must be capable of  
1421 operating for three days of high intensity or 7 days of low intensity without  
1422 external refueling operations while operating on the required DoD single fuel.

1423 **Rationale:** The FTTS-UV must have sufficient on-board fuel supply to  
1424 ensure that it can complete its defined OMS/MP missions without refuel. The  
1425 DoD has directed that all new acquisitions use a single kerosene based fuel.

1426 **Tires/Wheels.** The FTTS-UV shall have a run-flat capability with tire tread that  
1427 maximizes off-road mobility while maintaining safe on-road handling and that can  
1428 achieve tire wear life of a minimum of 12,000 miles (Threshold) (18,000 miles -  
1429 Objective) of OMS/MP use. The run-flat capability shall permit safe driving after  
1430 loss of air pressure in any two tires (Threshold) (all four tires - Objective) for at  
1431 least 30 miles (Threshold) (60 miles - Objective) without speed reduction over the  
1432 OMS/MP terrain.

1433 **Rationale.** Tire treads need to be designed primarily for off-road missions  
1434 at tactical standard mobility levels while at the same time they must be safe and  
1435 suitable for extended highway use as described in the OMS/MP. The run-flat  
1436 capability is needed to provide a get-away capability when under hostile  
1437 conditions and a limp home capability in the event of a flat tire while on a combat  
1438 mission. Tire life is important to maintain reasonable O&S costs and to keep  
1439 maintenance time devoted to tires to a minimum. The Objective parameters are  
1440 achievable goals that will reduce O&S costs due to tire wear by up to 50 percent.

1441 **Front-End Protection.** The FTTS-UV shall have front-end protection (e.g.,  
1442 brush guard/splash guards, etc.) to prevent damage to vehicle lights, body, and  
1443 engine components, and to reduce/prevent water/mud ingestion into the radiator  
1444 area while traveling cross-country at cross-country speeds.

1445 **Rationale.** Certain missions require the FTTS-UV to travel through areas of  
1446 heavy brush and shrubs. Front-end protection will protect vehicle engine  
1447 compartment and reduce damage caused by shrubs or similar debris impacting  
1448 the engine compartment. Splash protection may be necessary if water and mud  
1449 splash can damage or otherwise affect the operation of the vehicle. Brush  
1450 guards are acceptable.

1451 Prognostics & Diagnostics. The FTTS must incorporate an embedded prognostic  
1452 and embedded diagnostics system that identifies and displays fault data to the  
1453 individual component / LRU / LRM level. Both prognostics and diagnostics must  
1454 provide the level of detection and or isolation required to meet the stated  
1455 reliability and maintainability requirements. In order to provide maximum  
1456 coverage of critical failures, the embedded prognostics capability will

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1457 supplement, as appropriate for the critical components and their failure modes,  
1458 precursor-based prognostics with prognostics based on component life and  
1459 stress-histories.

1460 Prognostics: All FTTS platforms/modules will incorporate an embedded  
1461 prognostics capability that will accurately predict pending critical system failures  
1462 (any failures that cause system aborts IAW the reliability definition) to the  
1463 appropriate LRU (LRU defined as any part or component replaceable by field  
1464 maintenance personnel) that might occur in a 72 hour mission, early enough to  
1465 allow corrective action before the unit begins the mission. Prognostics will  
1466 provide coverage for 45% SA and 35% EFF at a 90% accuracy rate (threshold)  
1467 70%SA and 65% EFF at a 99% accuracy rate (objective).

1468 **Rationale:** A reliable embedded prognostics and diagnostics system will  
1469 provide accurate and timely information to the crew and maintenance personnel.  
1470 This is a primary enabler for the crew chief to be able to do the majority of the on-  
1471 system maintenance tasks. Prognostics are a combat effectiveness enabler and  
1472 not a logistics enabler. The contribution of the prognostics system is dependent  
1473 upon the coverage, accuracy, and lead-time of the applied sensors. Prognostics  
1474 will provide increased system health awareness and enable increased combat  
1475 effectiveness by reducing the risk of unexpected critical failures during a mission  
1476 pulse. However, mis-prognosis does lead to unnecessary maintenance actions  
1477 and therefore, contributes to the requirement for a larger than necessary logistics  
1478 footprint. For that reason, reliable and accurate prognostics are critical.

1479 Diagnostics: All FTTS platforms/modules will incorporate an embedded  
1480 diagnostics capability that will identify the system failures accurately to the  
1481 appropriate LRU (LRU being defined as any card, module or component  
1482 replaceable by field maintenance personnel), with notification first to the crew,  
1483 then to the supporting maintenance personnel (through the logistics STAMIS)  
1484 The Diagnostic Sensor Suite will provide 95% coverage and < 3% error rate  
1485 (Threshold) 99% coverage and < 2% error rate (Objective).

1486 **Rationale:** Diagnostics is both a combat effectiveness and logistics enabler.  
1487 The value of diagnostics is a function of coverage and accuracy. Diagnostics will  
1488 reduce the time required of the crew chief and/or maintainers to identify and  
1489 isolate a fault, which will enable the proper maintenance action to occur more  
1490 quickly. Mis-diagnosis, like a mis-prognosis, will lead to an unnecessary  
1491 maintenance action and adversely impact logistics footprint. The FTTS  
1492 maintenance concept, with a heavy reliance on "replace forward" by the operator  
1493 or CRT, requires accurate and timely troubleshooting of system failures and  
1494 reduction in the removal and replacement of incorrect components. Prognostics  
1495 and diagnostics values will be developed based on future modeling of  
1496 technological maturity estimates.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1497 Interrogation Capabilities. The FTTS will have vehicle-to-vehicle diagnostics  
1498 interrogation capabilities enabling the operator and/or Combat Repair Team  
1499 (CRT) to diagnose vehicle failures without ancillary TMDE.

1500 **Rationale:** By providing vehicle-to-vehicle back-up diagnostics capability,  
1501 portable TMDE within the UA can potentially be eliminated. This capability allows  
1502 vehicle diagnostics to be performed on non-operational vehicles.

1503 System Maintainability. Though it is expected that the FTTS will achieve high  
1504 levels of reliability, there will still be unscheduled failures and the need for  
1505 scheduled maintenance. Maintainability requirements ensure that the required  
1506 man-hours and clock-hours necessary to return the system to service are not  
1507 excessive, thereby allowing the system to be more readily mission capable.  
1508 FTTS platform designs should integrate pit stop-like efficiencies for repairing  
1509 failed systems with an ultimate goal of rapid return to combat capability. FTTS  
1510 platforms shall achieve the following minimum maintainability benchmarks:

- 1511 • Platform operator must be able to repair/replace at least 60% of SA, 60%  
1512 EFF, and 60% of NEFF unscheduled field maintenance requirements.
- 1513 • Mean time to repair (MTTR) must not exceed 0.5 hours.
- 1514 • Maximum time to repair (MaxTTR) for operator correctable faults must not  
1515 exceed 0.5 hours
- 1516 • Each FTTS platform/module shall contain the capability to perform  
1517 automated Preventive Maintenance Checks (PMC) Total time expended  
1518 on PMC will not exceed ten minutes to include non automated checks.

1519 **Rationale:** In order to meet combat power requirements for the FTTS, it is  
1520 imperative that systems are able to achieve assured mission reliability.

1521 FTTS-UV systems shall be designed to allow crews to perform on-site repairs.  
1522 80% of all LRUs replaced by operator maintainer.

1523 **Rationale:** Within the envisioned force structure, a significant percentage of  
1524 repair actions will be performed at operator level. In order for the operator and  
1525 limited organic support assets to be able to sustain the force, FTTS-UV systems  
1526 must be designed to minimize inherent repair time demands.

1527 The FTTS will require no more than 10 common tools on the on board and 10  
1528 additional common tools on the FTTS-MRV to perform all field level tasks. These  
1529 tools will be identical to the twenty tools used to perform all Field Level tasks on  
1530 the FSC FoS. There will be no special tools required for field level maintenance.

1531 **Rationale:** Reduces number of tools within the UA/UE, thus reducing the  
1532 logistics footprint

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1533 Interactive Electronic Technical Manuals (IETM). Each FTTS Manned System  
1534 must have an on-board, full IETM capability that includes operator and  
1535 maintainer technical manuals (TMs) and Repair Parts and Special Tool Lists  
1536 (RPSTL) for all onboard equipment, including GFE items (Threshold/Objective).  
1537 The embedded virtual full task trainer will be fielded concurrently with the FTTS.  
1538 All technical manuals must be Class 5 or higher, Interactive Electronic Technical  
1539 Manuals, and include an embedded training to assist the mechanic/operator in  
1540 performing maintenance tasks and diagnosis.

1541 **Rationale:** DoD Directive 1430.13 states that the acquisition of a training  
1542 system that supports a new defense system or piece of equipment shall be  
1543 assigned the same priority as that of the parent defense system or equipment. It  
1544 further stipulates that the device should be available in time for the fielding of the  
1545 parent system. A 2 Oct 02 SAAL-RP memo, subject: Fielding Systems with  
1546 Complete Training and/or Unit Support Systems reiterates the importance of the  
1547 Army's complying with this policy.

1548 I.E.T.M Embedded Video Maintenance Support. The FTTS IETM software  
1549 platform will allow the operator/maintainer to view actual video coverage on all  
1550 Field Level Maintenance Tasks. The operator/maintainer will use the IETM for  
1551 standard maintenance fault isolation tasks, on-system video maintenance task  
1552 demonstration, and on-system video instructional or refresher training. The IETM  
1553 will have a multi option capability allowing the maintainer to access various tasks  
1554 and use links to access video instructions/demonstrations for the task. The video  
1555 function must allow start, stop, pause, rewind, fast forward, and return to the  
1556 maintenance window. This will allow the maintainer the option of viewing a  
1557 maintenance task on video and returning to the maintenance procedures to begin  
1558 the task. The video will be formatted using memory reduced compression, and  
1559 can be viewed through a high quality resolution screen.

1560 **Rationale:** This is the primary enabler for the operator/maintainer  
1561 requirement supporting OF force structure. A comprehensive replacement  
1562 instruction media will assist in timely Field Maintenance by providing the  
1563 operator/maintainer a capability to reference and view all Field Maintenance  
1564 replacement tasks using instructional video coverage.

1565 Power

1566 **Rationale:** Electronic systems within the FTTS-UV will require an  
1567 operational environment conducive to efficient operation. Additionally, crew  
1568 comfort will allow for safer operation of the vehicle over long periods. Because  
1569 these systems are normally a power drain on the system, they must be efficient.

1570 The FTTS-UV shall minimize the maintenance, hazardous waste costs, and  
1571 storage requirements associated with conventional electrical power storage  
1572 devices. (i.e. Batteries)

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1573       **Rationale:** Reduces O&S costs and hazardous waste

1574 Training

1575 Any manned FTTS-UV platform must be capable of acting in a training mode  
1576 using embedded virtual training.

1577       **Rationale:** Virtual, training allows soldier-operators that are not part of the  
1578 training audience to initialize exercises, control the supporting, opposing, neutral  
1579 and non-governmental agency semi-automated forces (SAF), and facilitate After  
1580 Action Review preparations.

1581 A Training Management System (i.e., Standard Army Training System or a  
1582 derivative) must be part of the embedded training system.

1583       **Rationale:** The training management function cannot be suspended during  
1584 UA deployments.

1585 FTTS-UV training and training support systems must be backed up by a funded  
1586 Life Cycle Training Support System that can respond quickly to mission and  
1587 system related changes.

1588       **Rationale:** Embedded training systems cannot be physically separated from  
1589 its platform and therefore must be sustained as part of the FTTS-UV Life Cycle  
1590 Support System..

1591 Training software products will be compliant with appropriate standards, such as  
1592 the Joint Tactical Architecture - Army (JTA-A), the Army Training Information  
1593 Architecture (ATIA), the Common Training Instrumentation Architecture, and the  
1594 High Level Architecture (HLA).

1595       **Rationale:** These common standards enable the development of reusable  
1596 training software application product-lines that will facilitate dynamic updates,  
1597 minimize software maintenance costs, facilitate interoperability, and conserve  
1598 Army resources.

1599 FTTS-UV platforms shall have an embedded enroute mission planning and  
1600 rehearsal system (EMPRS) with the following capabilities - provide world-wide  
1601 communications and hardware/software applications sufficient to support  
1602 collaborative planning functions such as chat, file transfer, white boarding, and  
1603 teleconferencing between enroots, in-theater and in-CONUS commanders -  
1604 support development of a Training Support Package (TSP) for virtual distributed  
1605 collective training - produce simulation initialization files, produce a set of After  
1606 Action Review aides reflecting scenario planning factors (e.g., task organization,  
1607 mission, concept of operation, operational graphics) - be capable of preparing  
1608 and displaying non-traditional operational graphics representing the UofA  
1609 Patterns of Operations.

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1610 **Rationale:** Embedded training requires semi-automated forces, to surround  
1611 the training audience with adjacent, supporting, opposing and neutral forces that,  
1612 collectively form the combined arms training environment.

1613 C4ISR dynamic addressing capability must operate uninterrupted in the training  
1614 and mission rehearsal modes while simultaneously supporting ongoing military  
1615 operations.

1616 **Rationale:** Training exercises will normally involve one or more units within  
1617 the Unit of Action. Training exercises and real operational missions will require a  
1618 separate address lists.

1619 All operator and maintainer training documents must be delivered in a standard  
1620 format that must include identification of the structure or subcomponents of the  
1621 technical manual to facilitate sharing of the material between functional groups.

1622 **Rationale:** UA soldiers must be multi-faceted, adaptive and self aware-  
1623 knowing how to perform more tasks and because sustainment in the first 72  
1624 hours of a deployment on a non-linear battlefield will be limited, they must be  
1625 able to maintain their systems, often with knowledge obtained from knowledge  
1626 repositories over the C4ISR system.

1627 The FTTS-UV platform shall include, for each crewman, one removable  
1628 Crewman's Wireless Remote Interface System (CWRIS) that can connect to the  
1629 C4ISR system, wirelessly from within the vicinity of the platform in a secure  
1630 mode. The CWRIS will be able to operate without recharging for four hours of  
1631 continuous use. The CWRIS cradle within the FTTS-UV must provide a  
1632 recharging capability. The CWRIS will contain the Army's training management  
1633 system, the Scenario Generation System, Standard Army SAF and an image  
1634 generation and display capability. It will also be capable of either displaying a  
1635 duplicate image of the on-board command and control interface or the user  
1636 interface for reach back training. To communicate effectively with local  
1637 populations, the CWRIS will have a language translation capability (Text and  
1638 Voice). The CWRIS, when connected by wire (e.g., Ethernet) to other CRWIS's  
1639 will be capable of stand-alone, 'desktop', virtual collective training.

1640 **Rationale:** While the Embedded Training capabilities are enabled for on-  
1641 vehicle performance, it is unrealistic to require all training and training  
1642 management functions to be performed on vehicle all the time. Further, some  
1643 battlefield functions (e.g., maintenance, observation post duties, and interaction  
1644 with local populations) are performed in the vicinity of the vehicle. A CWRIS is a  
1645 multi-functional device which can support performance of off-vehicle / near-  
1646 vehicle battlefield functions while recognizing the peacetime reality of off-vehicle  
1647 training and training management.

1648 Embedded Training

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1649 Embedded Training will be inherent in FTTS-UV design and should take on two  
1650 roles. It can serve as a delivery mechanism for Interactive Multimedia (IMI) and  
1651 other computer based training. It will also serve as a means to embed the IETM  
1652 (Integrated Electronic Technical Manual ).

1653 **Rationale:** The communications capabilities in the FTTS-UV will support  
1654 downloads of training content that can be delivered to the soldier in his vehicle.  
1655 Embedded training devices should complement the user interfaces existing in the  
1656 vehicle, but should not duplicate controls found inside the vehicle.

1657 Interoperability TBD

1658 Information Exchange Requirements (IER).

1659 The FTTS-UV must communicate and transfer data through an organic electronic  
1660 vehicle/asset tracking system compatible with current (threshold) or emerging  
1661 (objective) C4I systems.

1662 **Rationale:** TBD

1663 The FTTS-UV shall comply with the most current version of the Joint Technical  
1664 Architecture (JTA).

1665 **Rationale:** TBD

1666 Vehicle logistic tracking system shall be in accordance with the Information  
1667 Dissemination Management (IDM) and/or the Global Information Grid (GIG)  
1668 Capstone Requirements Documents (CRDs) as applicable.

1669 **Rationale:** TBD

1670 Logistics and Readiness

1671 Logistics.

1672 The FTTS-UV must be supported by the standard Army logistics system.  
1673 Reliability and Maintainability (R&M) characteristics of the components of the  
1674 FTTS-UV shall be consistent with comparable systems currently in use in similar  
1675 commercial or DoD applications. The FTTS-UV shall be supported logistically by  
1676 both military and contract personnel using the most cost effective means  
1677 available during peacetime with acceptable risk when transitioning to wartime.  
1678 The FTTS-UV shall use to the greatest extent feasible built in test/built in test  
1679 equipment (BIT/BITE) and embedded diagnostics with Interactive Electronic  
1680 Technical Manual (ITEM) capability.

1681 **Rationale:** The FTTS-UV will operate in austere environments. Operators  
1682 must have the capability to perform PMCS, trouble shooting, and diagnosis and  
1683 repair mission essential equipment.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1684 The system shall be constructed of materials that will withstand on-deck storage  
1685 aboard pre-positioned afloat vessels. When stored, the FTTS-UV shall be  
1686 maintained so that it is readily available for deployment.

1687 **Rationale:** The FTTS-UV may be pre-positioned to meet ASMP time  
1688 requirements. The FTTS-UV must be maintained in a sufficiently robust manner  
1689 so as to avoid operational delays.

1690 Readiness. The FTTS-UV must attain a fully capable readiness status using the  
1691 Army's standard Army maintenance system, plus any specific test, measurement  
1692 and diagnostic equipment (TMDE).

1693 Reliability, Availability, and Maintainability Objectives. The FTTS-UV must have  
1694 a level of reliability that will ensure that the system will not fail under mission  
1695 profiles.

1696 **Rationale:** TBD

1697 Reliability To achieve high levels of system readiness and pulsed reliability,  
1698 FCS platforms must surpass legacy combat system reliability. Reliability  
1699 requirements are established to provide measurable system benchmarks that  
1700 establish equipment design parameters and drive platform  
1701 subsystem/component reliabilities. FCS platforms must achieve the following  
1702 system (Total mission package, including GFE) reliability benchmarks.

1703 Mean Time Between System Abort (MTBSA): (failures that deadline a platform,  
1704 result in unsafe operation, or make it non-mission capable): MTBSA for a 72  
1705 hour, high OPTEMPO mission pulse must be greater than or equal to 2800 hours

1706 Mean Time between Essential Function Failure (MTBEFF) is failure that results  
1707 in system degradation. The MTBEFF for a 72 hour, high OPTEMPO mission  
1708 pulse must be greater than or equal to 675 hours (Current complex systems have  
1709 demonstrated a ratio of 4 EFFs for each SA.)

1710 Mean Time Between System Abort –Mobility (MTBSA-M) failures are those that  
1711 affect a platform's mobility system, resulting in unsafe operation, or making it  
1712 non-combat capable. MTBSA-M for a 72 hour, high OPTEMPO mission pulse  
1713 must be greater than or equal to 6450 hours.

1714 ESOH and Other System Characteristics

1715 FTTS-UV shall possess mobility enhancements that reduce Soldier workload  
1716 through environmental ride quality and task automation

1717 **Rationale:** Specific human engineering enhancements will ensure each  
1718 FTTS-UV soldier arrives at the battle location in good condition, ready to fight  
1719 and win.

**DRAFT**

Future Tactical Truck System – Utility Vehicle

FTTS-UV

Emerging Desired Capabilities

1720 ANNEX A COMMAND AND CONTROL MODULE

1721

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1722 ANNEX B UTILITY MODULE

1723

1724 **Cargo Bed Cover.** The FTTS-UV shall have mounting provisions for the current  
1725 Army accepted Family of Cargo Bed Covers (CBC), Type I, FTTS-UV Version.

1726 **Rationale.** Certain using units require, for the accomplishment of their  
1727 mission, a lightweight hard-wall cargo bed cover. The ability of future FTTS-UVs  
1728 to accept the CBC for light vehicles eliminates the need to develop a new  
1729 lightweight hard wall cover.

1730 **Tarp and Bows Kit.** A tarp and bows kit for the FTTS-UV shall be made  
1731 available.

1732 **Rationale.** A tarp and bows kit is required by certain using units for the  
1733 accomplishment of their mission.

1734 **Snowplow Kit.** A snowplow kit that has capabilities at least as good as the  
1735 current light vehicle snowplow kit shall be made available for mounting on the  
1736 FTTS-UV. Use of the existing light vehicle snowplow is acceptable. Mounting  
1737 Modification Work Order (MWO) and power supply provisions shall be provided  
1738 with the kit.

1739 **Rationale.** Engineer units and other support elements are required to plow  
1740 snow in order to maintain Main Supply Routes (MSR) and all access roads and  
1741 roadways. Also, snow removal from staging areas, parking areas, helipads, and  
1742 similar areas is required to ensure safe operating conditions.

1743

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1744 ANNEX C AMBULANCE MODULE

1745

1746

### FTTS Utility-Ambulance

1747

1748

1749 **1.0 General.** FTTS Utility-Ambulance is a medical evacuation system within both  
1750 the Unit of Action and Unit of Employment. It shall maintain commonality in  
1751 chassis and parts with all types of FTTS vehicles to the greatest extent possible.  
1752 Requirements common to all FTTS Manned Systems are discussed in the FTTS  
1753 Utility ORD.

1754

1755 **1.1** The time sensitive nature of treating critically injured soldiers requires an  
1756 immediately responsive force health protection system with an expedient field  
1757 evacuation system. Air is the preferred method of casualty evacuation. Critical  
1758 patients cannot be held far forward for 3-7 days without evacuation to higher  
1759 echelon healthcare. Science and Technology are not expected to provide a  
1760 method to hold critically injured patients far forward in the Objective Force  
1761 timeframe (2015-2025). Dispersion of supported elements over extended areas  
1762 of operation, and changes in the OF operational environment will challenge the  
1763 medical support structure. To maximize survivability, severely injured casualties  
1764 must receive advanced Trauma Life Support within 1 hour. This is accomplished  
1765 by having an FTTS Utility-Ambulance configured for enroute patient care. The  
1766 FTTS Utility-Ambulance is an integral variant of the FTTS Utility that contributes  
1767 to sustaining and generating combat power to the OF structure.

1768

1769 **1.2** The major focus of the FTTS Utility-Ambulance will be to provide  
1770 uninterrupted, lifesaving medical treatment and evacuation throughout the  
1771 operational spectrum. The FTTS Utility-Ambulance must support all tactical  
1772 operations for a Major Theater War and/or tasks associated with Stability and  
1773 Support Operations (SASO) and peacekeeping and enforcement operations.

1774

1775 **2.0 Capabilities Required.**

1776

1777 **2.0.1 Responsiveness.**

1778

1779 **2.0.1.1 General.**

1780

1781 **2.0.1.1.1** No unique requirements.

1782

1783 **2.0.2 Deployability.**

1784

1785 **2.0.2.1 General.**

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1786

1787 **2.0.2.1.1** No unique requirements.

1788

1789 **2.0.3 Agility and Versatility.**

1790

1791 **2.0.3.1 General.**

1792

1793 **2.0.3.1.1** The FTTS Utility-Ambulance module must provide sufficient height to  
1794 be used as a evacuation platform, while retaining the capability of transporting  
1795 four litter patients (Threshold/Objective).

1796

1797 Rationale: This medical module will use the same chassis and internal  
1798 dimensions common to the base FTTS Utility platform. The vehicle must  
1799 allow sufficient space for medical personnel to provide the required  
1800 medical capabilities (i.e. treatment and evacuation on the battlefield) while  
1801 meeting the air transportability and deployment criteria.

1802

1803 **2.0.3.1.2** FTTS Utility-Ambulance module must be capable of treating and  
1804 evacuating patients during movement operations (en-route care)  
1805 (Threshold/Objective).

1806

1807 Rationale: The characteristics of the operational environment/OPTMPO,  
1808 based upon strategic war plans occasionally resulting in increased  
1809 dispersion of support elements over an extensive range of operations, and  
1810 unsecured LOCs, results in significantly increased casualty evacuation  
1811 times. This capability is therefore required for medical personnel to  
1812 maneuver, while supporting elements. This also decreases the duration  
1813 vehicles will remain stationary, making them less vulnerable to enemy  
1814 attack.

1815

1816 **2.0.4 Lethality.**

1817

1818 **2.0.4.1 General.**

1819

1820 **2.0.4.1.1** No unique requirements.

1821

1822 **2.0.5 Survivability.**

1823

1824 **2.0.5.1 General.**

1825

1826 **2.0.5.1.1** FTTS Utility-Ambulance module must be capable of displaying Geneva

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1827 Convention markings that can be removed/covered, without significant alteration  
1828 to the vehicle's camouflage pattern, within 2 minutes from outside the vehicle  
1829 (Threshold) and 1 minute from inside the vehicle (Objective).

1830

1831 Rationale: Medical transport vehicles are required to display Geneva  
1832 Convention markings when transporting personnel.

1833

1834 **2.0.5.1.2** FTTS Utility-Ambulance module must be capable of treating and  
1835 evacuating casualties while under a CBRN threat and in a contaminated  
1836 environment (Threshold/Objective).

1837

1838 Rationale: Casualty treatment and evacuation requires a stable  
1839 environment in which casualties can be fairly accurately and effectively  
1840 diagnosed and treated without the casualty, or medical personnel, being in  
1841 MOPP clothing/equipment.

1842

#### 1843 **2.0.6 Sustainability.**

1844

##### 1845 **2.0.6.1 General.**

1846

1847 **2.0.6.1.1** FTTS Utility-Ambulance module must be capable of conducting medical  
1848 procedures and treatments using networked tele-medicine interfaces, Medical  
1849 Command, Control, Communications, and Computers (MC4), and the Theater  
1850 Medical Information Program (TMIP) (Threshold/Objective).

1851

1852 Rationale: Restrictive medical force structure limitations and increased  
1853 dispersion of supported elements over extended ranges of operations will  
1854 result in decreased availability of physicians and Physician Assistants  
1855 further limiting the availability of more extensive medical treatment and  
1856 evacuation to the Warfighter. As a result, the individual combat medic will  
1857 require the capability to leverage technology in order to consult with a  
1858 physician or P.A. from the battlefield. TMIP is a joint program that  
1859 consolidates and makes accessible all forms of medical information  
1860 theater-wide to include all DMLSS applications.

1861

1862 **2.0.6.1.2** FTTS Utility-Ambulance module must be capable of supporting  
1863 physiological status monitoring equipment. (Threshold/Objective).

1864

1865 Rationale: The combat medic must be able to monitor the casualty's  
1866 physiological condition. This alerts the combat medic to assess when  
1867 further medical intervention is required.

1868

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

1869 **2.0.6.1.3** FTTS Utility-Ambulance module must be capable of conducting remote  
1870 triage (Threshold) in conjunction with Objective Force Warrior interfaces  
1871 (Objective).

1872

1873 Rationale: The ability to identify and monitor casualties remotely by triage  
1874 category is required. This optimizes the combat medic's ability to identify  
1875 and monitor a casualty's status without further exposure to enemy attack,  
1876 as well as allowing him to prioritize casualty care based upon available  
1877 data/resources.

1878

1879 **2.0.6.1.4** FTTS Utility-Ambulance module will have storage area(s) for the crew's  
1880 (three soldiers) individual gear and clothing. The module will provide accessible  
1881 and adequate interior space for ambulance mission package, individual  
1882 weapons, and NBC protective posture clothing/equipment. The storage area  
1883 must not interfere with the loading, unloading or the care of patients. The  
1884 storage area may not interfere with any deployability requirements  
1885 (Threshold/Objective).

1886

1887 Rationale: Currently crew's store their gear on a litter or patient  
1888 workstations (occupying valuable patient space) or outside the vehicle  
1889 (requiring the crew to expose themselves in order to access it). The  
1890 requirement is a medical evacuation asset which can function at full  
1891 operational capacity.

1892

1893 **2.0.6.1.5** Modularity of FTTS Utility-Ambulance compartment for all equipment to  
1894 include power supplies, Patient Movement Items (PMI), etc.

1895

1896 Rationale: FTTS Utility-Ambulance module must be capable of  
1897 incorporating all PMI. This includes adequate power storage modules  
1898 which permit easy access for use or removal during patient transport. PMI  
1899 storage must not interfere with treatment or transport of patients  
1900 (Threshold/Objective). PMI must stay with a casualty throughout the  
1901 evacuation. Some items, such as suction equipment and ventilators,  
1902 require electricity. The FTTS must provide a way to power these pieces of  
1903 equipment and allow easy transfer of such items between platforms, to  
1904 include U.S. Air Force and Army Aircraft.

1905

1906 **2.0.6.1.6** FTTS Utility-Ambulance module must be enabled by advanced  
1907 integrated healthcare systems capable of providing rapid medical diagnosis,  
1908 treatment, stabilization, resuscitation, advanced life support, and  
1909 monitoring/reporting real-time medical status during medical sustainment  
1910 operations, at time of fielding (Threshold/Objective).

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1911

1912

1913

1914

1915

1916

1917

1918

Rationale: The characteristics of the operational environment/OPTEMPO, coupled with severely restrictive medical force structure limitations, increased dispersion of supported elements over extended ranges of operations, and unsecured LOCs, will result in delayed access to more definitive health care. This will require enhanced medical technologies and capabilities, in order to save lives.

1919

**2.0.6.1.7** FTTS Utility-Ambulance module must have the capability to interface with the casualty's medical information device (carried by individual soldiers) and/or a collective medical records database. It must provide the ability to enter and retrieve medical records/information (Threshold/Objective).

1920

1921

1922

1923

1924

1925

1926

1927

1928

1929

1930

1931

1932

1933

1934

Rationale: The Electronic Information Carrier (EIC) will replace the Field Medical Card in the OF. FTTS Utility must have the capability to read the EIC, or other personal information system, used at the time of fielding. The entire system must provide a seamless, modular, expandable, and secure manner in which to rapidly acquire, transfer, and display critical medical information on the battlefield or other operational environment. The system must be compatible with all types of computer hardware, securely store text, voice, video, and digital data, have memory cells that do not require batteries, and be designed to allow the system to evolve with technology.

1935

**2.0.6.1.8** FTTS Utility-Ambulance module must allow medical personnel to move throughout the interior of the vehicle, while monitoring casualties and performing medical procedures from a stabilized position (Threshold/Objective).

1936

1937

1938

1939

1940

1941

1942

1943

Rationale: In order for the medical personnel to safely perform enroute monitoring and care they must be able to do so from a stable position without fear of being thrown about the interior and becoming another casualty.

1944

**2.0.6.1.9** FTTS Utility-Ambulance module must have a lighting system that will provide illumination throughout the work area. System must provide full white and blackout interior illumination with protected, individual fixture switches, and a master on/off switch. Lighting must be maneuverable to provide focused lighting in a specific area for patient treatment. Must contain a lighting system that will provide a general illumination of 110fc or greater throughout the work area. The system must also be capable of providing a focused, adjustable illumination of 240fc at the treatment site. The lighting system must have a blackout, master on/off control, dimming, and automatic shutoff capability. It must also be

1945

1946

1947

1948

1949

1950

1951

1952

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1953 compatible for use when the occupants are wearing a night vision goggle (NVG)  
1954 device (Threshold/Objective).

1955

1956 Rationale: Patient treatment requires additional lighting capabilities  
1957 beyond the requirements for all manned platforms. The 240fc illumination  
1958 is the required amount of lighting to enable the medical crew to perform  
1959 necessary procedures. The lighting must be maneuverable to reduce  
1960 shadows at wound/ treatment sites.

1961

1962 **2.0.6.1.10** FTTS Utility-Ambulance module must provide easily accessible  
1963 storage for medical equipment sets (MES) and other medical supplies. Essential  
1964 MES must be stored inside the vehicle, with additional items stored on the  
1965 vehicle (Threshold). Must provide adequate storage for MES and additional  
1966 medical supplies inside the vehicle (Objective). The storage area must not  
1967 interfere with air/rail loading requirements or the care of wounded.

1968

1969 Rationale: All of the TO&E/CTA equipment and supplies must be stored  
1970 on board the vehicle in such a manner that the medical personnel have  
1971 easy access to them, but they are not in the way of the medical personnel  
1972 performing their job. The interior work area must be free for hands-on  
1973 airway management, hemorrhage control, and patient monitoring. In order  
1974 to accomplish these critical life-saving tasks the medical crew must be  
1975 able to readily access the medical equipment sets while stationary, or on  
1976 the move. Additional space is required for re-supply items and any soldier  
1977 owned equipment/weapons evacuated with the soldier.

1978

1979 **2.0.6.1.11** FTTS Utility-Ambulance module must provide on-board medical  
1980 suction. This includes variable controlled, continuous suction to all patient  
1981 stations with a 2-liter disposable container, minimum vacuum capability of 51  
1982 kPa, and a flow rate of 1.4 L/s (Threshold), TBD (Objective).

1983

1984 Rationale: The need to evacuate bodily fluids, clear airways, and clear  
1985 wounds/ surgical sites is very important during emergency treatment. The  
1986 capability to remove excess blood and other body fluids will ensure that  
1987 the casualty receives vital emergency treatment and enroute care.

1988

1989 **2.0.6.1.12** FTTS Utility-Ambulance module must have the capability to support  
1990 and stabilize two 1000-ml IV bags at each litter/treatment station  
1991 Threshold/Objective).

1992

1993 Rationale: A holder will prevent the IV bag from interfering in-patient  
1994 loading, unloading, and treatment procedures. Two are needed for each

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

1995 station because some patients may need an IV in each arm, and 1000-ml  
1996 is the standard bag size. In addition, the holder will stabilize the bag during  
1997 transport and allow medical personnel to accurately observe the  
1998 transfusion flow.

1999

2000 **2.0.6.1.13** The FTTS Utility-Ambulance module must have an on-board capability  
2001 to generate, store, and provide an equivalent adjustable flow rate (3-15 liter/min)  
2002 of oxygen to four stations simultaneously (Threshold/Objective).

2003

2004 Rationale: Providing oxygen, as soon after injury as possible, at the rate of  
2005 3-15 liters per minute, is vital to enhancing the casualty's ability to survive.  
2006 An effective flow rate of 3-15 liters of oxygen per minute permits the use of  
2007 a demand oxygen controller. A delivery system will prevent oxygen tubing  
2008 to one patient from interfering with loading, unloading, or treatment of  
2009 other patients. Medical vehicles require an on-board oxygen producing  
2010 system, in order to reduce the safety concerns of handling (and the  
2011 logistics burden of re-supplying) bottled oxygen, which is the system  
2012 currently used.

2013

2014 **2.0.6.1.14** In all climate conditions, the FTTS Utility-Ambulance must provide a  
2015 climate control unit (heating/cooling) that provides a stable patient environment  
2016 temperature (60-85 degrees F) throughout the patient transport/care area  
2017 (Objective), or stable environmental temperature zones (60-85 degrees F) at  
2018 each ambulatory seat and litter berth (Threshold). The climate control system  
2019 must not detract from the medical attendant's ability to view patients or conduct  
2020 treatment and must allow a controllable adequate airflow to sustain each  
2021 casualty.

2022

2023 Rationale: Casualty treatment and evacuation necessitates a stable  
2024 patient environment within the vehicle. Patients must be transported in a  
2025 temperature-controlled environment to prevent degradation of their  
2026 condition from either hypo or hyperthermia. Because the vehicle will  
2027 operate in climatic extremes as specified in the base ORD it is important  
2028 that the wounded soldier be transported in a clinically acceptable  
2029 temperature range.

2030

2031

2032 **2.0.6.1.15** The FTTS Utility-Ambulance module must be capable of on-board  
2033 water heating to 100 degrees F (Threshold) and 150 degrees F (Objective).

2034

2035

2036

Rationale: Hot water is necessary for hygiene and sanitation and is  
imperative to warm IVs in cold weather.

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

2037

2038 **2.0.6.1.16** The FTTS Utility-Ambulance module must provide MANPRINT and  
2039 human factors acceptable ambulatory and litter patient loading and unloading  
2040 with 5% female soldiers loading a 95% male patient, using Army standard four-  
2041 man carry/loading techniques (Threshold/Objective).

2042

2043 Rationale: Ease of access is imperative for the ability to quickly and safely  
2044 load litter patients into the litter berths. This reduces risk of exposure to  
2045 hostile activity or inclement weather.

2046

2047 **2.0.6.1.17** The FTTS Utility-Ambulance module must provide the capability to  
2048 carry a combination of up to four (4) litter (NATO Standard Litters) and/or six (6)  
2049 ambulatory casualties, in addition to the medical crew of three (3) soldiers, within  
2050 the interior of the vehicle (Threshold/Objective).

2051

2052 Rationale: The dispersion of supported forces and the lack of adequate  
2053 ground/air evacuation capabilities make it critical that all available vehicles  
2054 have the ability to transport a large number of casualties. The operational  
2055 consequence of not meeting this requirement is the inability to evacuate,  
2056 treat, and return-to-duty combat soldiers, thus restricting the commander's  
2057 maneuverability and operational control, and his ability to defeat the  
2058 threat.

2059

2060 **2.0.6.1.18** The FTTS Utility-Ambulance module must provide for 28-inches  
2061 (lateral) and 18-inches (vertical) clearance between standard litters, in the loaded  
2062 configuration. (Threshold/Objective).

2063

2064 Rationale: Evacuation vehicles must provide adequate room between litters to

2065

allow the combat medic sufficient space to provide advanced trauma

2066

management (ATM) and enroute care.

2067

2068 **2.0.6.1.19** The FTTS Utility-Ambulance must have an accessible attendant's seat  
2069 that will allow the attendant to change position and visually monitor all patients  
2070 while the vehicle is in motion.

2071

2072 Rationale: It is necessary for medical personnel to be seated while the  
2073 vehicle is in motion to prevent injury, however medical personnel must be  
2074 able to monitor the patient's condition while the vehicle is in motion.

2075

# DRAFT

## Future Tactical Truck System – Utility Vehicle

### FTTS-UV

#### Emerging Desired Capabilities

2076 **2.0.6.1.20** Must be capable of supporting associated medical equipment (vital  
2077 signs monitor and suction apparatus, etc.) with 110/220 volts AC 60 Hz and 24  
2078 volts DC with the vehicle engine operating (Threshold); by an auxiliary power  
2079 supply without vehicle engine operating (Objective).

2080

2081

Rationale: Necessary to provide the necessary power requirements to

2082

operate medical equipment needed for patient care.

2083

2084 **2.0.6.1.21** . Must provide easy access for ambulatory and litter patient loading  
2085 and unloading using Army standard four-man carry/loading techniques.

2086

2087

Rationale: Ease of access is imperative for the ability to quickly and safely

2088

load litter patients into the litter berths. This reduces risk of exposure to

2089

hostile activity or inclement weather.

2090

2091 **2.0.6.1.22** Provide litter lift and support system to accommodate safe loading,  
2092 unloading, and transport of patients in the upper litter berths.

2093

2094

2095

2096

2097

2098

2099

2100

2101

Rationale for change: Based on information gained from product development and testing involving the Armored Medical Evacuation Vehicle (Bradley chassis-based ambulance), there is a significant MANPRINT/safety issue involved with the ability for the crew to safely load, transport, and unload litter patients in the upper litter berths. Body positioning and lifting techniques required to load patients in the upper berths could cause back injury.

2102

#### **2.0.7 Training.**

2103

2104

##### **2.0.7.1 General.**

2105

2106

##### **2.0.7.1.1** No unique requirements.

2108

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

2109 ANNEX D COMPANION TRAILER

2110

2111 FTTS-UV Companion Trailer shall have the following characteristics:

2112 Control. The FTTS-UV companion trailer should be independently controlled by  
2113 no more than one operator from within the truck's cab for self deployment  
2114 missions.

2115 **Rationale:** The FTTS-UV trailer may be self deployed to deliver  
2116 cargo/supplies to combat units to promote expediency in resupply operations.

2117 Tracking. The FTTS-UV companion trailer shall be designed to ensure proper  
2118 tracking behind the prime mover.

2119 **Rationale:** This requirement enhances the safe operational characteristics of  
2120 both the prime mover and trailer.

2121 Mobility Degradation. While empty or fully loaded, the FTTS-UV companion  
2122 trailer shall cause no decrease in the mobility characteristics of the prime mover

2123 **Rationale:** This requirement ensures the FTTS-UV with its companion trailer  
2124 is able to keep pace with other critical UA systems.

2125 Brakes.

2126 The FTTS-UV companion trailer shall have a braking system that activates when  
2127 separated from the prime mover and shall hold the trailer on a 30 percent  
2128 longitudinal slope (in either direction) when uncoupled.

2129 The operator shall easily disengage this capability in the event the trailer must be  
2130 moved when uncoupled from the prime mover.

2131 The FTTS-UV companion trailer shall meet current military and federal motor  
2132 vehicle safety standards, such as FMCSR.

2133 It is necessary that the brake system be designed to allow for safe and effective  
2134 operation when coupled or uncoupled from the prime mover. A brake system  
2135 that activates when separated from the prime mover and can hold on a 30  
2136 percent slope is needed to allow positioning the trailer on uneven terrain and  
2137 ramps in Roll-On/Roll-Off (RO/RO) vessels. The operator must disengage the  
2138 brake system to permit repositioning the trailer when it is not appropriate or  
2139 required to use the prime mover.

2140 Coupling/Uncoupling. The FTTS-UV companion trailer shall be capable of being  
2141 coupled/uncoupled by one soldier and free standing on both hard and soft  
2142 surfaces when fully loaded and not attached to the prime mover.

2143 **Rationale:** The prime mover will have a crew of one; therefore, it is essential  
2144 that only one soldier couple/uncouple the trailer to meet system emplacement

## DRAFT

### Future Tactical Truck System – Utility Vehicle

#### FTTS-UV

#### Emerging Desired Capabilities

2145 demands. The trailer must be free standing when uncoupled to allow for  
2146 autonomous operation.

2147 **747** Expediency Towing. The FTTS-UV companion trailer shall capable of being  
2148 safely towed by the pintle of legacy trucks for emergency movement.

2149 **Rationale:** This requirement is needed to ensure compatibility with legacy  
2150 prime movers in the event it becomes necessary to tow the trailer with a legacy  
2151 truck in an emergency situation. It is recognized that such emergency operation  
2152 may require operation at a reduced performance level.

2153 **753** Backing Truck-Trailer Combination. The FTTS-UV companion trailer shall  
2154 be capable of being backed safely from any normal position (such as when in a  
2155 turn but not from full jackknife) without damage to truck, trailer, or payload, and  
2156 without necessity for operator dismounting or other preparation.

2157 **Rationale:** Safe backing of the truck with trailer is imperative to ensure  
2158 safe operation in both peacetime highway operations and wartime tactical  
2159 operations. Backing frequently becomes necessary to permit extrication from an  
2160 untenable situation or to improve a tactical operational position.

2161 **761** Wheels. The FTTS-UV companion trailer shall have lug nuts, tires and  
2162 wheels compatible with the FTTS-UV.

2163 **Rationale:** This requirement is needed to reduce the logistic burden and  
2164 to improve operator maintainability of both vehicles. The ability to replace a truck  
2165 wheel with a wheel from the trailer may mean the difference between returning to  
2166 the security of the UA or being captured.

2167
